²³ Über 80% der Inhalte im Internet sind kommerziell ausgerichtet, die Tendenz ist steigend. Nicht 10% aller Webseiten haben natur- oder geisteswissenschaftliche Themen zum Inhalt. (LAWRENCE / GILES 1999 : 107)

32

dementsprechend qualifiziert ist oder nicht. Oder wie es der Münsteraner Bibliothekar Dr. Oliver OBST ausdrückt: „*Jeder Idiot kann etwas auf dem Internet veröffentlichen und jeder Idiot tut es auch.*“ (OBST 1997) Daher ist es oft schwer zu erkennen, wie glaubwürdig Daten oder Informationen wirklich sind. Artikel in Zeitschriften, Magazinen, Lexika oder Bücher durchlaufen einen für den Leser unsichtbaren Prozess der Kontrolle. Editoren als Experten lesen und bewerten Artikel oder Bücher und geben diese erst nach genauer Prüfung zur Veröffentlichung frei. Große wissenschaftliche Journale, wie z.B. „The Lancet“ oder das „The New England Journal of Medicine“, haben Ablehnungsquoten von bis zu 90% (vgl. OBST 2000; ROBERTS 1999). Das Peer-Review Verfahren und andere Methoden sorgen als Qualitätsfilter dafür, dass

nur nach dem gegenwärtigen Stand der Wissenschaft korrekte Informationen publiziert werden. Dieser entscheidende Filtermechanismus fehlt so gut wie im Internet, somit liegt es beim Nutzer, die Gefahren eigenständig zu erkennen.

Die Qualität von Online-Information wird zumeist negativ eingeschätzt, insbesondere wird dem Medium ein Glaubwürdigkeitsdefizit zugesprochen, da die Information nicht mehr an das geschriebene bzw. gedruckte Wort gekoppelt ist, wie es bei Büchern oder Zeitschriften der Fall ist. Hinzu kommt, dass dem Internet eine Tendenz der Vermischung von Realität und Virtualität zugeschrieben wird, was insbesondere an den

zahlreichen Verschwörungstheorien, die im Netz kursieren, deutlich wird (vgl. DEBATIN

1998).

Der Journalist David SHENK betitelte sein Buch „Datenmüll und

Infosmog“ (1998),

MEIER spricht von

² 1999b : 163), die

„Informationsmüllhalde“ (MEIER

Tageszeitung

„Frankfurter Rundschau“ nennt das Netz ein „Gerüchtemedium, die Gerüchteküche

par

excellence“ (zitiert nach SCHWEIGER 1999 : 97) und die „New York Times“

schrrieb,

einer Website zu trauen „is like following a helpful stranger in Morocco who offers

to

take you to the best drug store“ (zitiert nach NIELSEN 1999b).

Empirische

Untersuchungen weisen sehr unterschiedliche

Ergebnisse

bezüglich der

Glaubwürdigkeit des Internet auf. Neueren Umfragen zufolge bezeichnen immerhin

50% der Befragten das Medium „Internet“ als glaubwürdig. Hiermit rangiert es in

der

Rangliste vor „Zeitschriften“ (46%), aber weit hinter „Zeitungen“ (74%),

„Fernsehen“

(82%) und „Radio“ (87%). In einer anderen Umfrage, in der allerdings nach

dem

Medium mit der höchsten Glaubwürdigkeit gefragt wurde, sprachen nur 1%

der

Personen dem „Internet“ diese zu (vgl. RÖSSLER / WIRTH 1999b : 8).

Martin

GOLDMANN weist allerdings zu recht darauf hin, dass man kein Internet braucht,

um

sich von den Medien belügen zu lassen: „Fernsehen, Zeitschriften sowie Radio

bieten

genauso kanalisierte, vorgekaute Nachrichten und Halbwahrheiten“ (1999 :

22).

Allerdings sind Informationen im Internet anders geartet als in herkömmlichen

Medien,

da es im Internet zu einer Verschmelzung verschiedener Medientypen (Video, Audio etc.) kommt. Es gibt zwar auch bei Printmedien eine große Bandbreite von Formaten, von der Regenbogenpresse bis hin zum streng wissenschaftlichen Magazin, aber im

Internet ist sie erheblich größer, da sie stärker von Promotion und Werbung durchsetzt ist, was das Differenzieren wesentlich erschwert. Diese Bandbreite entsteht durch die schon erwähnte Möglichkeit, dass jeder Mensch mit einem Zugang zum Internet ein Massenpublikum mit seiner Botschaft erreichen kann. (Vgl. ROBERTS 1999; RÖSSLER / OGNIANOVA 1999 : 111; SCHWEIGER 1999 : 96; TILLMAN 2000)

Die Gefahr liegt nicht nur in Fehlinformationen, d.h. dass eine Angabe wirklich falsch ist, sondern die viel größere Gefahr birgt die Grauzone, die im Netz existiert. Dieser Bereich enthält Seiten, die einen radikalen Standpunkt vertreten, stark übertreiben, polemisieren oder parodieren, letztere werden meist als „Hoax“

²⁴ bezeichnet.

Diese Seiten können durchaus auch einen positiven Effekt haben. Zum einen können sie einen alternativen Standpunkt im Gegensatz zur gängigen öffentlichen Meinung vertreten, zum anderen schulen solche Seiten den kritischen Blick und das Hinterfragen von Informationen. Sie zeigen, dass jede Art von Information eine subjektive Tendenz hat, die es nötig macht, sie zu evaluieren. (Vgl. PIPER 2000; MINKEL 2000 : 33)
Diese Grauzone von Webseiten lässt sich in verschiedene Kategorien unterteilen, wobei viele Webseiten durchaus in mehrere dieser Kategorien fallen können:

- Parodien und Satire
- Fiktive Inhalte
- Gezielte Desinformation
- Fälschungen

- Propaganda

- Gehackte Seiten

²⁴ „Hoax“ bedeutet übersetzt Schwindel, Falschmeldung oder Ente. Dieser Begriff hat sich im Netz als allgemeine Bezeichnung für falsche Warnungen per E-Mail und gefälschte Webseiten etabliert. Hinzugefügt auch TU Berlin (www.tu-berlin.de/www/software/hoax.html) oder Universität Hamburg (minerva.sozialwiss.uni-hamburg.de/majordomo/hoax.html) [beide Stand 31.07.2001].

GREER et al. (1999b) und PIPER (2000) führen auch „Werbung“ in dieser Kategorisierung, aber aufgrund der rein kommerziellen Inhalte von Werbung werde ich in dieser Arbeit nicht näher darauf eingehen.

3.5.1 Parodien und Satire

Sehr häufig im Netz anzutreffen ist die Kategorie der Parodie (engl. „*parody*“ oder „*spoof*“), wobei insbesondere die politische Satire oder Parodien auf Computerfirmen, speziell Microsoft, sehr beliebt sind. Parodien sind nie ernstgemeint und meist als solche schnell zu erkennen. Wobei PIPER (2000) und MINKEL (2000 : 33) zu Recht darauf hinweisen, dass bei gut gemachten Parodien leichtgläubige Menschen und Kinder trotzdem darauf hereinfallen können. Problematisch ist es oft auch, wenn Suchmaschinen Unterseiten einer Website finden und als Suchergebnis präsentieren, so dass man nicht den direkten Bezug zur Hauptseite erkennt, die deutlich macht, dass es sich hierbei um Satire handelt. So ist es

schon des öfteren vorgekommen, dass Meldungen des Satire-Internetmagazins „The Onion“ (www.onion.com) in seriösen Arbeiten und Nachrichten zitiert wurden (vgl. PIPER 2000). Bei Parodien wird zumeist der Domain-Name mit einer anderen Top-Level-Domain (z.B. .org oder .net) übernommen oder der Name wird leicht verfälscht, z.B. aus der Adresse der Weltbank „worldbank.org“ wird „whirledbank.org“, aus „microsoft.com“ wird „microshaft.com“ oder aus „altavista.com“ wird „hastalavista.com“.

- **Whitehouse.gov / .com / .org / .net**

Das Weiße Haus stellt im Netz ein beliebtes Objekt für Parodien dar. Hier wird auch die oben angesprochene Übernahme von Namen mit anderer Top-Level-Domain (TLD) deutlich. Die Originalseite besitzt die US-staatliche Top-Level-Domain .gov

(whitehouse.gov) (s. Abb. 4

a).

Parodien dieser Seite sind u.a. zu finden

unter:

- Whitehouse.org ²⁵, die die Originalseite am rechten Rand mit
 Werbung
 verschiedener Energiekonzerne verziert, die den Wahlkampf des jetzigen US-
 Präsidenten George W. Bush unterstützten (s. Abb. 4
 b).
- Whitehouse.net, die mit der Parodie auf politische Geschehnisse in den
 USA
 anspielt. ²⁶ Die Abbildung zeigt einen fingierten Hackerangriff durch
 Chinesen
 nach dem Absturz eines amerikanischen Spionageflugzeuges in China (s.
 Abb.
 4
 c).
- Whitehouse.com, die hier nur der Vollständigkeit halber genannt wird, da es
 sich hier um keine Parodie handelt, sondern um die Seite eines Pornographie-
 Anbieters (s. Abb. 4 d). Dies aber zeigt, wie wichtig es ist, auf die TLD
 der
 jeweiligen Internet-Adresse zu
 achten.

a.

b.

c.

d.

Abb. 4: Die Index-Seite von a.) www.whitehouse.gov, b.) www.whitehouse.org [beide Stand: 29.08.2001], c.) www.whitehouse.net und d.) www.whitehouse.com [beide Stand: 10.11.2001]

²⁵ Die Seite ist seit dem 11.09.2001 aufgrund des terroristischen Anschlages auf das World Trade Center und des Pentagons aus dem Netz genommen und durch eine Kondolenz-Seite ersetzt

²⁶ Die Entstehung und Historie der Seite ist unter <http://www.whitehouse.net/protest.html> [Stand: 28.09.2001] nachzulesen.

36

• Clones-R-Us

Auch naturwissenschaftliche Parodien sind im Netz vertreten. Das Angebot reicht von einfachen Artikeln über absichtlich falsche Studien, wie z.B. „Feline Reactions to

Bearded Men“ (www.improb.com/airchives/classical/cat/cat.html), bis hin

zur kompletten, vielschichtigen Site, wie z.B. die von „Dream Technologies International“

(www.d-b.net/dti/) mit Clones-R-Us (s. Abb.

5).

Auf dieser Seite bietet die Firma „Dreamtech“ das Klonen von Menschen an. Die Seite

erläutert das Klonen anschaulich, gestützt auf Kommentaren

imaginärer

Wissenschaftler, bietet diverse Statistiken an und lässt begeisterte Kunden zu

Wort

kommen. Die Linksammlung beinhaltet Verweise zu bekannten, real existierenden

Universitäten und anderen ernstgemeinten wissenschaftlichen Seiten zum Thema

Klonen im Netz. Dass es sich um eine Parodie handelt, erkennt man u.a. an den

Punkten „Price List“ und „Order Form“ in der Navigationsleiste. Hier kann man

erfahren, was ein Klon von sich selbst oder einer bekannten Persönlichkeit kostet.

Ein

Klon des Models Cindy Crawford gibt es für 79.999.- US-\$, im Gegensatz dazu

kostet
 ein Klon des ehemaligen US-Präsidenten John F. Kennedy nur 499.- US-\$. Über
 ein
 Bestellformular auf der Webseite kann man gleich seinen gewünschten Klon
 anfordern.
 Unter „About Us“ wird klargestellt, dass es sich um eine Parodie handelt und die
 Seite
 nur zum Nachdenken über das Klonen von Menschen anregen will. Dieser Diskurs
 lässt
 sich im „Guestbook“
 nachlesen.

Abb. 5: Index-Seite von „Dream Technologies International“ (www.d-b.net/dti/) [Stand: 10.11.2001]

37

3.5.2 Fiktive Inhalte

Parodien beinhalten immer einen Bezug zur Realität. Es existieren aber auch Seiten mit rein fiktivem Inhalt, der jedoch als Realität dargestellt wird. Hier lassen sich zwei Arten

unterscheiden. Zum einen die Seiten, die nur der reinen Unterhaltung dienen, wie z.

B.

die Seite des Mikrostaates „Molossia“ (www.molossia.org). Ebenso die Seiten über

die beiden im US-Bundestaat Minnesota gelegenen Städte „Mankato“

(www.lme.mankato.msus.edu/mankato/mankato.html) und „New Hartford“

(lme.mnsu.edu/newhartford/newhtfd.html), die nur im Internet und auf

keiner Landkarte existieren. Beliebte sind auch Seiten über fiktive Tiere, wie z.B. das „Mountain Walrus“ (www.end.com/jynx/walrus/) oder den „Pacific Northwest Tree Octopus“ (zapatopi.net/treeoctopus.html). Aber es gibt auch durchaus fiktive Seiten mit einem ernstgemeinten wissenschaftlichen Hintergrund, allerdings ist dies eher selten der Fall. Die Webseite des fiktiven Landes „Ruritania“ (homepages.udayton.edu/ahern/rurindx.htm) informiert über die geographische Lage des Landes und über historische und demographische Daten. Das Land „Ruritania“ hat über 4 Millionen Bewohner und liegt in Skandinavien zwischen Norwegen und Schweden. Das Ganze ist ein Projekt des Fachbereiches Politik der Universität Dayton / USA und dient als Anschauungsobjekt und Simulation eines Staates im universitären Lehrbetrieb.

3.5.3 Gezielte Desinformation

Die bisher genannten Kategorien (Parodien und fiktive Inhalte) sind zwar auch eine Art von Desinformation, aber diese Inhalte sind zumeist offensichtlich nicht ernstgemeint, so dass daraus keine schwerwiegenden Konsequenzen erfolgen. Die gezielte Verbreitung von Falschmeldungen im Internet dagegen, die dann Einzug in die übrige Medienwelt erhalten, wird inzwischen als „Media-Hack“ bezeichnet. Diese neue Generation von Hackern will nach eigenem Bekunden durch die Lügen im Netz eine gesellschaftliche Diskussion anstoßen. Um Erfolg zu haben, müssen die Geschichte also glauben und weitererzählen, muss „*die Geschichte ... wahr sein können*“ sagt die Netzkünstlerin und Hackerin Lizlvx (MIKA 2000). So geschehen z.B. mit der Webseite

„**Voteauction**.com“, die während des letzten Präsidentschaftswahlkampfes in den USA

anbot, Wählerstimmen gegen Geld zu kaufen. Obwohl es nie zu einem Handel mit Stimmen kam, wurde die Seite verklagt und auf richterlichen Beschluss hin abgeschaltet. Die Macher wollten mit ihrer Aktion den Leuten verdeutlichen, wieviel ihre Stimme in einem Wahlkampf, der über 3 Milliarden US-\$ kostete, eigentlich wert ist. (Vgl. MIKA 2000; KREMPLE 2000; MEDOSCH 2001)
Schwerwiegender wird der Fall meist bei falschen medizinischen oder finanziellen Informationsangeboten, die im Extremfall zum Tode oder Ruin führen können.

Medizinische Desinformation

Informationen über Krankheiten und deren Heilung gehören im Internet zu den gefragtesten Themen (vgl. OBST 1997; AMBRE et al. 1997 : 1-1). Neben seriösen medizinischen Datenbanken, wie z.B. die „MedLine“²⁷, existieren auch unzählige unseriöse und ethisch bedenkliche Quellen im Netz. Da verspricht William Donald

Kelley, der sich selbst als „Medical Missionary“ bezeichnet, auf seiner Webseite:
„There is no cure for the common cold. But there is a very simple CURE for cancer.“
(www.ioa.com/dragonfly/news/kelley.html). Gestützt wird diese These von dubiosen medizinischen Erkenntnissen und Verschwörungstheorien.

Betty Martini erklärte in einer Mail, die an über 450 Newsgroups ging, dass Süßstoff der Auslöser für Multiple Sklerose und Hauttuberkulose ist (www.nancymarkle.com/betty/betty.html) und schaffte damit den Sprung auf diverse Titelblätter. Die Behauptung wurde inzwischen von Experten widerlegt, aber nichtsdestotrotz glauben viele Betroffene heute noch immer daran. (Vgl. PIPER 2000; KELLEY 1999)

Das „Institute for Investigative Medicine“, dem u.a. die Nobelpreisträgerin für Chemie Kary Mullis angehört, schreibt auf der „AIDS Myth Site“ (www.virusmyth.com/aids/index.htm), dass AIDS weder durch den HIV-Virus ausgelöst noch sexuell übertragen wird, sondern dass die Infizierten an den

Nebenwirkungen der Medikamente sterben. Diese Aussagen werden sehr umfangreich

²⁷ Der Zugang zum öffentlichen Teil der „Medline“, der „PubMed“, ist <http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?db=PubMed> [Stand:30.09.2001] zu erreichen.

und mit Hilfe international anerkannter Wissenschaftler näher erläutert, so dass man sich fragen muss, ob dies wirklich nur dubiose und falsche Erkenntnisse sind, oder ob es sich vielleicht doch um eine unpopuläre, aber innerhalb des wissenschaftlichen Diskurses vertretbare Sichtweise handelt. Die Macher selbst beklagen sich darüber, dass ihr Standpunkt durch Zensur unterdrückt wird (vgl. PIPER 2000).

Organisationen wie „Quackwatch“ (www.quackwatch.com) und das „Center for Disease Control and Prevention (CDC)“ (www.cdc.gov/hoax_rumors.htm) geben einen Überblick über Quacksalber und warnen vor deren dubiosen Methoden im Internet.

Wirtschaftliche Desinformation

Das Interesse an Aktien von Kleinanlegern ist durch das Internet und den dadurch entstandenen Boom des neuen Marktes stark gefördert worden. Jederzeit kann man ohne Probleme die aktuellen weltweiten Börsenkurse abrufen und sich mit den neuesten Wirtschaftsinformationen versorgen. Aber genau hier liegt das Problem. Am 3. November 2000 kursierte im Internet die Meldung, dass der Chef des Softwareunternehmens „Oracle“, Larry Ellison, gestorben und der gesamte Vorstand der Firma zurückgetreten sei. Diese Meldung führte zu massiven Kurseinbrüchen, die die Aktie verlor um 29% ihres Wertes. Diese Falschmeldung war der Mitauslöser dafür, dass die Anleger innerhalb eines halben Tages 50 Milliarden US-Dollar verloren (vgl.

MÜLLER 2000). Ende August 2000 verschickte ein amerikanischer Student eine Mail an den Presse-Distributor „Internet Wire“ (www.internetwire.com). Die Mail hatte den Anschein, als sei sie von der Firma „Emulex“ (www.emulex.com) versandt worden, die darin mitteilte, dass die Geschäftsberichte neu geschrieben werden müssten und von der

amerikanischen Börsenaufsicht zur Zeit überprüft würden. Die katastrophale Fehlinformation wurde umgehend von Börsendiensten aufgenommen und verbreitet, mit der Folge, dass der Aktienkurs der Firma „Emulex“ binnen Minuten um 60% fiel.

40

Während ein Großteil der Aktionäre bei diesem Kurseinbruch viel Geld verlor, profitierte der Student durch diese Talfahrt, da er sogenannte Leerverkäufe

28 („short

sales“) getätigt hatte und somit in kurzer Zeit 240.000 US-\$ Gewinn machte (vgl. REDAKTION INTERN.DE 2000; KREMPL 2000).

3.5.4 Fälschungen

Gefälschte Webseiten (engl. „*counterfeit*“) bergen mit die größte Gefahr im Netz, denn diese versuchen, andere Seiten durch geschickte Adaptierung von journalistisch relevanten Regeln und Formaten nachzuahmen, so dass sie mit den ernstgemeinten Originalseiten verwechselt werden können. Inhaltlich wird das Thema seriös dargestellt, dass im Gegensatz zur Originalseite nicht objektiv, sondern subjektiv und voreingenommen berichtet. Sie dienen meist der gezielten Verbreitung von Fehlinformationen und Propaganda. PIPER (2000) vergleicht diesen Typus von Website auch mit dem Trojanischen Pferd, da sie nicht das darstellt, was sie in Wirklichkeit ist. Bei einem solchem Hoax wird zumeist eine thematisch eindeutige WWW-Adresse genommen, so dass der User diese schneller findet und für eine offizielle Seite hält, so bei dem unten aufgeführten Beispiel der Website über Martin Luther King, Jr.,

deren
Adresse www.martinlutherking.org
ist.

Ein anderes Beispiel ist die Fälschung der Seite der Welthandelsorganisation (WTO), die nach dem Allgemeinen Zoll- und Handelsabkommen (GATT) benannt ist:

www.gatt.org. Die offizielle Seite ist unter www.wto.org zu finden. (Vgl.

PIPER
2000)

Zudem wird oft das Grunddesign der Site übernommen, wie z.B. Seitenaufteilung, Farbgebung, Form der Buttons oder der Navigationszeile, so dass es schon optisch leicht zu Verwechslungen kommen kann und der User damit nicht erkennt, dass es sich um eine Fälschung handelt.

²⁸ *Definition:* „Leerverkauf (Blankoverkauf): Bei Termingeschäften der Verkauf von Wertpapieren, Devisen oder Waren, die der Verkäufer noch nicht besitzt, sondern erst später erwirbt, in der Erwartung, sich bis zum Erfüllungstermin zu niedrigeren Kursen bzw. Preisen eindecken zu können, als es nach Abschluß des Termingeschäfts möglich ist.“ (SCHREIBER 2000 : 290)

- www.martinlutherking.org

Als Beispiel für eine solche Fälschung sei hier die Seite „Martin Luther King, Jr. – An Historical Examination“ (www.martinlutherking.org) genannt (s. Abb. 6).

Abb. 6: Fälschung: Index-Seite „Martin Luther King, Jr. – An Historical Examination“

www.martinlutherking.org [Stand:
10.11.2001]

Diese Site berichtet über das Leben und Werk des amerikanischen Bürgerrechtlers und scheint oberflächlich somit eine „offizielle“ Martin Luther King Webseite zu sein. Dieser Eindruck wird durch die WWW-Adresse verstärkt. Auch die eindeutige Navigationsstruktur u.a. mit Hinweisen zu seinen Schriften („Historical Writings“) und anderen Bürgerrechtsbewegungen („Jews & Civil Rights“) sowie das klare und übersichtliche Design weisen auf eine professionell erstellte Seite hin. Hinweise für einen Hoax erkennt man erst bei näherer Betrachtung der Inhalte. Schon auf der Titelseite steht ein zweifelhaftes Zitat aus der amerikanischen Zeitschrift „Newsweek“:
„... - including Kings cries of ,*Im f...ing for God*’ and ,*Im not a Negro tonight!*“
Gewissheit für den zweifelhaften Inhalt dieser Seite bekommt man beim Anklicken des Links „Contact the Webmaster“, der eine E-Mail Adresse der rechtsradikalen Organisation „Stormfront“ öffnet. Auch die darunterliegenden Seiten verbreiten rechtsradikales Gedankengut.

42

Eine objektive Seite über den Bürgerrechtler ist unter <http://www.thekingcenter.com/> zu finden. Das Design gleicht sich nicht nur bei der Farbgebung mit den verschiedenen Grautönen und der gelben Schrift, auch die Anordnung der verschiedenen Elemente ist sehr ähnlich: das zentrale Porträt in schwarzweiß, das Martin Luther King Zitat auf der linken Seite und die seitliche Navigationsleiste rechts, die eine ähnliche Unterteilung aufweist (s. Abb.

7).

Abb. 7: Original: Index-Seite „The King Center“ (www.thekingcenter.com) [Stand: 10.11.2001]

3.5.5 Propaganda

Ein weiteres Problem im Netz ist das der Propaganda. Diese gilt als systematischer

Manipulationsversuch, d.h. es wird versucht, durch die Verbreitung von Informationen, Fakten, Gerüchten, Halbwahrheiten und Lügen die öffentliche Meinung zielgerichtet zu

manipulieren. Dieses Mittel wird im Netz oft von verfassungsfeindlichen Parteien und

Organisationen benutzt. Sie kommunizieren über das Internet, um somit rechtlichen

Problemen leicht ausweichen zu können.

Dieses sehr umfassende Problem soll es hier nur kurz exemplarisch dargestellt werden.

Weiterführende Informationen zu diesem Thema sind auf den Seiten der „Gesellschaft

Sozialwissenschaftlicher Infrastruktureinrichtungen“ (GESIS) (www.social-science-geis.de/Information/Themen/Fokus/) oder auf der Seite „Wissenschaft plus Politik“ (staff-www.uni-marburg.de/rillingr/root1.html) zu finden.

Ein Beispiel für gezielte politische Propaganda im WWW stellt die Seite des „Institute for Historical Review“ (www.ihr.org) dar. Auf deren Anfangsseite steht, dass die Site wissenschaftliche Informationen und nachdenkliche Kommentare zu neuzeitlichen politischen Ereignissen bietet, so z.B. zum 2. Weltkrieg, dem Holocaust und dem Konzentrationslager Auschwitz, und dabei weder ideologisch noch politisch noch

konfessionell in der Berichterstattung ist. Das Gegenteil ist jedoch der Fall. Genau wie es für eine solche Seite typisch ist (vgl. GREER et al. 1999b), werden der Holocaust verneint und die Auschwitz-Lüge propagiert. Die weiterführenden Links führen zu Seiten, die auch diesen Standpunkt vertreten, so z.B. zur rechtsradikalen „Zündelsite“ (www.zundelsite.org) oder zur Stiftung „Vrij Historisch Onderzoek“ (vho.org), die Personen juristisch unterstützt, die nicht an die Existenz von Gaskammern glauben und aufgrund dessen angeklagt sind.

3.5.6 Gehackte Webseiten

Der typische Hack einer Website ist eindeutig zu erkennen. Hacker hinterlassen auf der entsprechenden Seite meist einen Hinweis, dass sie die Seite gehackt haben, zumeist gefolgt von politischen Statements und einer grafischen Entstellung der Seite, was dann als „defacement“ (Entstellung) bezeichnet wird. Dieser Typus ist nur sehr kurzlebig und deshalb auch nur selten anzutreffen, da er schnell entdeckt wird und sofort durch die reguläre Seite wieder ersetzt wird (vgl. PIPER 2000). Aufgrund dieser Kurzlebigkeit archivieren einige Hackergruppen diese Seiten. Solche

Archive sind z.B. bei „Attrition“ (www.attrition.org/mirror/attrition/) oder „Onething“ (www.onething.com/archive/) zu finden.

Viel schwieriger zu erkennen sind sogenannte News-Hacks. Dabei manipulieren

Hacker Nachrichten in News-Angeboten im Web. Diese Art des Hacks taucht zur
Zeit
immer häufiger auf, weil er sehr einfach durchzuführen ist. Zum Eindringen in solche

Web Content Management Systeme ist neben dem Wissen nicht mehr als ein
üblicher
Internet-Browser nötig. (vgl. POULSEN 2001; REDAKTION INTERN.DE
2001)
Im August 2001 drang der 20-jährige Adrian Lamo bei „Yahoo.com“ ein,
änderte
bestehende Nachrichten und veröffentlichte selbst neue. Diese Änderungen waren
so
minimal, dass sie tagelang nicht auffielen. Erst als der Hacker selbst die
Firma
„Security Focus“ darüber informierte, fielen die Änderungen auf und „Yahoo.
com“
schloss die Sicherheitslücke. Lamo war selbst erstaunt und schockiert, wie einfach
das
Eindringen in das System war und welche Macht man durch die Manipulation
von
Nachrichten haben kann. Er
sagte:

*„At that point I had more potential readership than the Washington Post. ... It could
have caused a lot of people who were interested in the days events a lot of
unwarranted grief if false and misleading information had been put
nach (POULSEN
2001)*

Diese Gefahr ist nicht zu unterschätzen, da Nachrichtenseiten zu den beliebtesten
Angeboten im Netz zählen. Nach den Terroranschlägen auf New York und
Washington
am 11. September 2001 zählten Nachrichtenagenturen über 15 Millionen Zugriffe,
und
bei „Yahoo.com“ verdoppelten sich die Zugriffszahlen des gesamten Monats
innerhalb
von Stunden (vgl. POULSEN 2001; SIEGLE 2001 : 101). Knapp drei Wochen
später
ergab eine Umfrage in den USA, dass das Internet inzwischen hinter dem
Fernsehen
zur zweitwichtigsten Informationsquelle für Berichte über die
Terroranschläge
geworden war (vgl. HARRIS INTERACTIVE
2001).
Dass dieses Thema ein sehr wichtiges im Internet war, belegt die Statistik
der
Suchmaschine „Google.com“. Die neun der zehn häufigsten Suchbegriffe im
September 2001 standen alle im Zusammenhang mit den Terroranschlägen, nur

Computerwurm „Nimda“ schaffte es auch in die Liste: 1. „Nostradamus“, 2. „CNN“, 3. „World Trade Center“, 4. „Osama Bin Laden“, 5. „Taliban“, 6. „Afghanistan“, 7. „Nimda“, 8. „American Flag“, 9. „BBC“ und 10. „FBI“ (www.google.com/press/-zeitgeist/zeitgeist-sept.html).²⁹

Die Frage, die sich hier stellt: Was hätten in diesem Falle Falschmeldungen im WWW über Attentäter und Opfer für einen Schaden anrichten können? Allein schon harmlose

²⁹ Mehr über die Rolle von „Google“ während der Ereignisse in New York bei Richard W. Wiggins „The Effects of September 11 on the Leading Search Engine“ (www.firstmonday.dk/issues/issue6_10/wiggins/index.html) [Stand: 16.10.2001]. Unter <http://www.google.com/press/zeitgeist/9-11-search.html> [Stand 16.10.2001] bietet „Google“ exakte Statistiken zu Zugriffszahlen am 11. September 2001.

45

Urban Legends, wie eine falsche Nostradamus Prophezeiung oder die unzähligen gefälschten Fotos, sorgten weltweit für Diskussionen (vgl. SIEGLE 2001 : 102).

³⁰

³⁰ Urbane Legenden, Falschmeldungen und manipulierte Fotos zu dem Terroranschlag auf das Trade Center in New York sind auf der Site „Rumors of War“ (www.snopes2.com/rumors/rumors.html), Terrorist Attack Hoax Watch“ (www.csicop.org/hoaxwatch/) [beide Stand: 04.10.2001] zu finden.

46

4. Aspekte der Evaluation von Webseiten

Das vorhergehende Kapitel hat deutlich gemacht, dass die Informationsfülle des Internet ihren Preis hat, da die Quellen einer hohen inhaltlichen wie gestalterischen Fluktuation unterliegen, schwer auffindbar, leicht zu manipulieren und zu fälschen sind und meist die Quantität der Qualität überwiegt. Daraus ergibt sich ein sehr zweigeteiltes Bild des Rechercheinstruments „Internet“. Diese Aussage wird durch eine Umfrage, die von Martin SONNLEITNER, Marcus STADTHAUS und Stephan WEICHERT durchgeführt wurde, deutlicher. Sie befragten Redakteure verschiedener deutscher Tages- und Wochenzeitungen nach Vor-

und
Nachteilen der Online-Recherche. Positiv wurde besonders die „Zeitersparnis“ und
die
„Ergiebigkeit“ bewertet, da über das Netz ein schneller Zugriff auf ein breites

Spektrum von Informationen möglich ist. Im Gegensatz dazu wurde insbesondere
die
„Oberflächlichkeit“ und die „Unglaubwürdigkeit“ von Online-Quellen moniert.

(Vgl.
SONNLEITNER/STADTHAUS/WEICHERT 1999 : 252

f.)
Eine Studie von Wolfgang SCHWEIGER ergab ähnliche Ergebnisse. Hier werden
dem
WWW gegenüber dem Fernsehen und der Tageszeitung Attribute wie
„unseriös“,
„schlecht recherchiert“, „unkritisch“ und „unglaubwürdig“ zugesprochen (1999 :
102).

Dem Netz wird als einziger Pluspunkt ein dynamischeres, „frecheres“ Image
verglichen
mit anderen Medien zugestanden, was dadurch erklärt wird, dass jeder seine
Meinung
in Form einer Website publizieren kann, und darin liegt „*offensichtlich auch in
der
Wahrnehmung des Publikums eine Stärke des Mediums*“ (ebd. :
103).

Das wachsende Interesse an Online-Quellen, ausgelöst durch das starke Wachstum des

World Wide Web, führte dazu, dass ab Mitte der 90er Jahre Angehörige
von
Universitäten und Bibliotheken sich verstärkt mit der Entwicklung von
theoretischen
und praktischen Methoden der Evaluation von Webseiten beschäftigten. Da Online-

Informationen in vielfältiger Form vorliegen (Webseiten, Newsgroup-Artikel etc.),
und
es keine generellen Bestimmungen zur Formatierung von Webseiten gibt, konnte
und
kann auch heute noch keine Software den Evaluationsprozess übernehmen und
muss
somit manuell vom Menschen vorgenommen werden (vgl. ANAGNOSTELIS /
COX
1996).

Es bildeten sich zwei Arten von Evaluationsansätzen für Onlinequellen heraus
(vgl.
CIÖLEK
1996):

1. Die Bewertung von Online-Quellen durch Editoren und Redaktionen, die diese zu Linksammlungen und kommentierten Katalogen zusammenführten, um somit die qualitativ hochwertigen Angebote vom Rest des Netzes zu trennen.

2. Die individuelle Bewertung anhand der von Universitäten und Bibliotheken entwickelten Kriterienkataloge oder Checklisten, deren Hauptaugenmerk auf Wahrnehmung, Analyse und Vergleich von gefundenen Webseiten liegt.

4.1 Evaluationsdienste im Netz: Awards, Review-Dienste und Portale

Suchmaschinen und Kataloge sollen dem Surfer helfen, Informationen zu finden,

aber diese Suche führt zu diversen Problemen. Hierzu gehören, wie schon in Kapitel 3 erläutert, das Auffinden von qualitativ hochwertigen Quellen und die Glaubwürdigkeit von Webseiten. Deshalb existieren im Internet unzählige Dienste, die Webseiten bewerten, wobei man hier zwei grundsätzliche Systeme unterscheiden muss: Zum einen gibt es Awards und Zertifikate, d.h. Organisationen, Zeitschriften oder

Privatpersonen rezensieren Webangebote und zeichnen diese dann aus. Diese Art des Qualitätssiegels ist aber mit Skepsis zu betrachten, da nur selten Evaluationskriterien offengelegt werden und es nur wenige wirklich seriöse Anbieter gibt. (Vgl. BRAUN 2001 : 117) Zum anderen existieren seit Mitte der 90er Jahre im WWW Review-Dienste und themen-basierte Portale (engl. „*subject-based gateways*“), die von Universitäten, Bibliotheken, aber auch von kommerziellen Anbietern verwaltet werden. Ihr Ziel ist es, dem User mit Hilfe von Experten zusammengestellte Linksammlungen gezielt und effektiv qualitativ hochwertige Informationen zu präsentieren. Im Gegensatz zu

Katalogen, wie z.B. „Yahoo.com“ oder „Web.de“, unterliegen diese Dienste genauen Evaluationskriterien, die sie auch öffentlich bekanntmachen. (Vgl. COOKE / McNAB / ANAGNOSTELIS 1996; COOKE 1999 : 27 f.)

Aufgrund des enormen Aufwandes einer Evaluation lässt sich ableiten: Je genauer die Evaluation vom jeweiligen Anbieter durchgeführt wird, desto kleiner wird die Anzahl der angebotenen Quellen, aber auch desto qualitativ besser die Auswahl der Links (s. Abb. 8).

Abb. 8: Vor- und Nachteile verschiedener Suchdienste & Kataloge (COOKE 1999 : 49)

4.1.1 Awards & Zertifikate

Die Datenbank „Awards.de“ führte im Oktober dieses Jahres über 3000 bekannte Awards auf, wobei die eigentliche Ziffer der im Netz kursierenden Auszeichnungen bei über 10.000 liegen mag (vgl. BRAUN 2001 : 116). Das Problem ist, dass diese Awards (s. Abb. 9) zumeist von Privatpersonen vergeben werden, die einfach für sie interessante Webseiten auszeichnen, ohne hierbei auf einen ernsthaften Kriterienkatalog zurückzugreifen und somit in den meisten Fällen kein Qualitätssiegel darstellen. Verliehen werden diese Awards aufgrund ihrer mangelnden Reputation nur an private Homepages.

Abb. 9: Auswahl typischer Awards privater
Homepages

Bei Awards von Zeitschriften sieht die Situation schon anders aus. Der „Weka Computerzeitschriften Verlag“ rezensiert Webangebote und zeichnet die besten deutschsprachigen Websites mit dem „Webtip“ (www.webtip.de) aus (s. Abb. 10). Die Rezensenten hierbei sind Experten. Allerdings werden nur zwei Kriterien bewertet, nämlich Inhalt und Design, wobei die Gewichtung der Kriterien bei einzelnen Kategorien unterschiedlich angewandt wird. Durch die Bewertung der Seiten durch Experten hebt sich ein solches Online-Angebot zwar deutlich von den anderen Awards ab, aber durch den sehr kleinen Kriterienkatalog bietet auch eine solche Seite nur einen geringen Qualitätsstandard.

Abb. 10: Webtip- Logo

Ein wirklicher Qualitätsstandard kann nur durch eine strenge Evaluierung von Experten gesichert werden. Dies ist z.B. bei dem Zertifikat „HON - Code of Conduct“ der Fall. Dieser Code wurde 1996 von der „Health on the Net Foundation (HON)“ (www.hon.ch) entwickelt, zu deren Mitgliedern u.a. die Weltgesundheitsorganisation (WHO), das Kernforschungszentrum CERN (Conseil Européen pour la Recherche Nucléaire) und die Europäische Union gehören. Das Ziel dieser Stiftung war und ist es,

neue Technologien in der Medizin zu fördern. Mit dem „HON - Code of Conduct“ werden medizinische Quellen ausgezeichnet, die sehr strenge Richtlinien erfüllen. So dürfen u.a. *„alle medizinischen und gesundheitsbezogenen Ratschläge, die auf dieser Website erteilt werden, nur von medizinisch/gesundheitswissenschaftlich geschulten und qualifizierten Fachleuten gegeben“* (HEALTH ON THE NET FOUNDATION 1997) werden. Die Erfüllung der Richtlinien wird von der HON streng überwacht. Somit kann der User sicher sein, dass Webseiten mit dem HON-Logo (s. Abb. 11) glaubhafte und wissenschaftliche Informationen beinhalten.

Abb. 11: Logo des „HON – Code of Conduct“ (2-fach vergrößert)

4.1.2 Review-Dienste

Die meisten Suchmaschinen und Kataloge bieten inzwischen eine Art Review-Dienst an, in dem bestimmte Quellen hervorgehoben werden. So gibt es z.B. bei „Web.de“ die Kategorie „Cool Spot“, in die laut „Web.de“ (surftipps.web.de/cool/) besonders gute Webseiten aufgenommen werden. Aber der Name macht schon ein Problem deutlich, denn hier werden „coole“ Seiten aufgeführt. Doch was bedeutet „cool“? Damit

weder etwas über die Qualität des Inhalts der einzelnen Seite ausgesagt, noch werden Auswahlkriterien, geschweige denn Evaluationskriterien aufgeführt, so dass man bei solchen Kategorisierungen kaum von einem wirklichen Review-Dienst sprechen kann. (Vgl. RETTIG 1996; ANAGNOSTELIS / COOKE / McNAB 1997; SMITH 1997) Anders ist es bei dem wohl bekanntesten Review-Dienst im Internet, „Argus Clearinghouse (ACH)“ (www.clearinghouse.net). Dieses Projekt der Universität Michigan / USA entstand im Jahre 1993 mit dem Ziel, jedem Internet User einen Zugang zu nützlichen und wertvollen Internetquellen zu ermöglichen. Dazu werden die Quellen von Universitätsangehörigen gesichtet, beschrieben und evaluiert und anschließend bewertet in den thematisch sortierten Katalog aufgenommen. Beurteilt werden fünf Kategorien: Inhalt, Qualität, Design, Struktur und Meta-Informationen, wie z.B. Autor und Aktualität der Seite (vgl. ARGUS ASSOCIATES 2000; TILLMAN 2000). Positiv bewertete Seiten dürfen das „Seal of Approval“ (s. Abb. 4.5) auf ihrer Eingangsseite einblenden.

Abb. 12: Auszeichnung von Argus Clearinghouse (www.clearinghouse.net)

4.1.3 Themen-basierte Portale

Themen-basierte Portale werden zumeist von Bibliothekaren oder Experten erstellt, die zum Ziel haben, Benutzer mit qualitativ sehr hochwertigen Internet-Quellen zu versorgen. Diese Portale werden oft auch als „virtuelle Bibliotheken“ bezeichnet. (Vgl. ANAGNOSTELIS / COOKE / McNAB 1997; SMITH 1997; COOKE 1999 : 34) Im Jahre 1993 wurde in England das Projekt „Electronic Library Programme (eLib)“

gestartet und stellt heute das größte seiner Art dar. Zu diesem Projekt gehören inzwischen eine Vielzahl von Informationsportalen, die verschiedene natur- und geisteswissenschaftliche Bereiche abdecken:

ADAM : The Art, Design, Architecture and Media Information Gateway

(www.adam.ac.uk)

uk)

Biz/ed : The Business and Economics Gateway (www.bized.ac.uk)

uk)

EEVL : The Edinburgh Engineering Virtual Library (www.eevl.ac.uk)

uk)

OMNI : Organizing Medical Networked Information (omni.ac.uk)

uk)

RUDI : Resources for Urban Design Information (rudi.herts.ac.uk)

uk)

SOSIG : The Social Science Information Gateway (sosig.ac.uk)

uk)

Jedes dieser Portale bietet Zugriff auf Ressourcen im Internet, die von Bibliothekaren nach strengen Richtlinien ausgewählt und evaluiert worden sind. Zu jedem Eintrag werden entsprechende Informationen und Zusammenfassungen der Quelle angeboten.

(Vgl. COOKE 1999 :

35)

Der Vorteil solcher virtueller Bibliotheken liegt eindeutig in der sehr guten Auswahl

der Quellen, die eine hohe Informationsqualität sicherstellt. Auch werden hier die

Evaluationskriterien genau definiert und dokumentiert, so dass der

Evaluationsvorgang

nachvollziehbar ist.

³¹

Im Gegensatz zu Suchmaschinen und Katalogen bieten virtuelle

Bibliotheken nicht nur einen Überblick über Quellen im World Wide Web, sondern

auch Newsgroups, Mailinglisten und FTP-Server werden mit ins

Angebot

aufgenommen. Aber aus der strengen Auswahl an Informationen ergibt sich auch ein

Nachteil, der in der Limitierung der Quellen liegt. (Vgl. COOKE 1999 : 40

f.)

³¹ Die genauen Evaluationskriterien von „SOSIG“ z.B. sind unter <http://www.sosig.ac.uk/desire/-ecrit.html> [Stand:22.10.2001] zu finden.

4.2 Individuelle Evaluationsmethoden

Da Review-Dienste und Portale jedoch nur wenige Seiten im WWW abdecken und zudem dem schnellen Wachstum des Netzes nicht folgen können, sind individuelle Evaluationsmethoden gefragt. In ersten theoretischen Überlegungen versuchten CIOLEK (1997, ursprünglich 1994), CAYWOOD (1995), TILLMAN (2000, ursprünglich 1995), GRASSIAN (1996) und SMITH (1997) essentielle Merkmale von Webseiten und deren Inhalte zu erfassen und somit Indikatoren für Qualitätsmerkmale zu erstellen. Diese sollen als Orientierungs- und Faustregeln für die Evaluation gelten. Die folgende Auflistung stellt nur die Hauptmerkmale der Methoden vor. Jeder dieser Punkte ist meist noch in verschiedene Unterpunkte unterteilt.

CIOLEK bewertet die Einzigartigkeit der Quelle, dazu Inhalt, Auffindbarkeit im Netz, Zugang, Struktur, Formatierung und Pflege der Seite (1997).

CAYWOOD bewertet in sehr knapper Form hauptsächlich drei Punkte: Zugang, Design und Inhalt (1995).

TILLMAN bewertet die Bandbreite der angebotenen Informationen, die Leichtigkeit der Identifizierung von Meta-Daten (Autor, Aktualität etc.), die Stabilität von Online-Quellen und die Benutzerfreundlichkeit (2000).

GRASSIAN bewertet Inhalt, Quelle, Aktualität und Struktur (1996).

SMITH bewertet vier Aspekte sehr ausführlich: inhaltliche, rhetorisch-kommunikative, multimedial-interaktive Aspekte und die Kostendimension (1997).

Seitdem wurden die Evaluationsmethoden ständig weiterentwickelt. Stellvertretend seien hier AMBRE et al. (1997), SCHROCK (1998), COOKE (1999), ALEXANDER / TATE (1999), HARRIS (2000), KIRK (2001) und das EU-Projekt „DESIRE“ (www.desire.org), aus dem der „Internet Detective“ (PLACE / HIOM /

1999) entstanden ist, genannt. Bei diesen Methoden wurden zumeist die Basismerkmale der vorhergegangenen Methoden übernommen und lediglich weiter verfeinert oder neu zusammengefasst, so dass auch hierbei kein allgemeingültiger Kanon von Kriterien entstanden ist. Aber alle diese Methoden haben einen gemeinsamen Kern, wobei sich die Kriterien der Evaluation von netzexternen Dokumenten (z.B. Zeitschriften, Bücher, Datenbanken, CD-ROMs etc.) in der Regel nicht sonderlich von denen der Webseiten unterscheiden. Folgende Kernkriterien sind allgemein gültig (vgl. RETTIG 1996; DEBATIN 1998):

- Glaubwürdigkeit
- Zuverlässigkeit
- Objektivität
- Richtigkeit
- Genauigkeit
- Aktualität
- Nachweisbarkeit
- Benutzerfreundlichkeit
- Zugänglichkeit

Der größte Unterschied bei der Evaluation von netzexternen Dateien und Webseiten besteht in der Zeitdimension und der Multimedialität. Die Zeit spielt aufgrund der Aktualität und einfachen Veränderbarkeit von Webseiten eine große Rolle. Hinzu kommen die Elemente des Hypertextes, die durch die Verlinkung zu anderen Seiten oder Textteilen den Text aus einer chronologischen Reihenfolge herausheben, wie es beispielsweise bei einem Buch der Fall wäre. Die Multimedialität zeigt sich durch die Möglichkeit, interaktive und audio-visuelle

Elemente, wie z.B. Videos oder Audiodateien, einzufügen (vgl. DEBATIN 1998; TILLMAN 2000).

4.3 Evaluationskriterien

Zur Evaluation von Information ist, wie schon erwähnt, ein genau definierter Kriterienkatalog vonnöten. Hierzu gehören aber nicht nur die unten aufgeführten

Aspekte Glaubwürdigkeit, Genauigkeit, Abdeckung, Ausgewogenheit,

Nachweisbarkeit und die Benutzerfreundlichkeit, sondern auch einige allgemeine grundsätzliche Aspekte. Diese müssen vor Beginn der eigentlichen Evaluation kontrolliert werden. Zuerst muss festgestellt werden, um welchen Typus von Online-

Quelle es sich handelt: um die Homepage einer Organisation oder einer Privatperson oder ist es eine thematisch-orientierte Seite? Andere Quellen, wie FTP Archive, Newsgroup-Artikel, FAQs oder Datenbanken werden in dieser Arbeit nicht berücksichtigt. [32](#)

Die Identifizierung der Art der Quelle ist deshalb wichtig, weil der Typus einen Einfluss auf den Schwerpunkt der verschiedenen Evaluationskriterien besitzt. Die Frage z.B. nach der Glaubwürdigkeit ist bei einer privaten Homepage viel höher einzuschätzen als bei der Website einer Universität, die schon aufgrund der Institution eine hohe Glaubwürdigkeit und Reputation besitzt. Ein anderes Beispiel ist die Aktualität, die bei Seiten aus dem IT- oder Nachrichtensektor eine größere Rolle spielt als bei historischen Webseiten. (Vgl. COOKE 1999 : 85; HARRIS 2000 : 60;

GREER
et al.
1999c)

Der hier aufgestellte Kriterienkatalog zur Evaluation von Webseiten orientiert sich hauptsächlich an den Überlegungen von Robert HARRIS (2000), Alison COOKE

(1999), Janet ALEXANDER & Marsha Ann TATE (1999) und John AMBRE et al. (1997).

Die wichtigsten Aspekte der Evaluation mit ihren jeweiligen Unterpunkten sind:

1. Glaubwürdigkeit
 - a. Allgemeine Plausibilität der Quelle
 - b. Kompetenz des Autors
 - c. Hinweis auf Institution / Organisation

³² Mehr zur Evaluation dieser Typen der Online-Quellen bei COOKE (1999 : 85).

- d. Hinweis auf Review-Verfahren
 - e. Internet - Domain
2. Genauigkeit und Abdeckung
 - a. Aktualität
 - b. Genauigkeit der Quelle
 - c. Abdeckung des Themas
 - d. Absicht und Zielgruppe
3. Ausgewogenheit
 - a. Objektivität

- b. Folgerichtigkeit
4. Quellennachweise
- a. Kontaktmöglichkeit
 - b. Quellenverzeichnis
 - c. Bestätigung durch Dritte
5. Benutzerfreundlichkeit
- a. Struktur und Navigation
 - b. Zugang
 - c. Ausnutzung interaktiver und multimedialer Möglichkeiten

Am Schluss steht dann die Einschätzung der Gesamtqualität, die aber erst nach einem Vergleich mit anderen Quellen geschehen kann, um diese in Relation zu setzen (vgl. COOKE 1999 : 80 f.; MEIER 1999b : 188). Wichtig dabei zu beachten ist, dass es zum Teil keine deutliche Abgrenzung gibt und manche Faktoren bei mehreren Kriterien eine Rolle spielen. So sind z.B. Review-

Verfahren nicht nur für die Glaubwürdigkeit bedeutsam, sondern auch für die Genauigkeit der Quelle. Bei der Evaluation ist zu bedenken, dass die vom Evaluator gemachte Einschätzung immer subjektiv ist (DEBATIN 1998). HARRIS (2000 : 60) bezeichnet die Evaluation auch als Kunst und macht deutlich, dass es keinen perfekten einzelnen Indikator zur

Evaluation von Informationen gibt, sondern dass nur eine Schlussfolgerung aus einer Anzahl von verschiedenen Anhaltspunkten und Indikatoren gezogen werden kann.

Jedem Kapitel folgt eine Reihe von Leitfragen, die dem Evaluator helfen sollen,

Anhaltspunkte innerhalb der Quelle zu finden, um die einzelnen Aspekte der Evaluation in die Praxis umzusetzen.

4.3.1 Glaubwürdigkeit

Der wichtigste Punkt der Evaluation ist die Glaubwürdigkeit der Quelle, denn hiermit steht oder fällt die Informationsqualität (vgl. HARRIS 2000 : 99; AMBRE et al. 1997 :

2-

3).

Das Ziel einer jeden Quelle muss es sein, gute und vor allem nachweisbare Gründe zu liefern, damit man dieser trauen kann, denn Vertrauen ist der Schlüssel zur Glaubwürdigkeit (vgl. HARRIS 2000 : 61). Wie ist dies erreichbar?

Die Merkmale einer glaubwürdigen Seite sind oft logisch und leicht zu erschließen.

Zum einen ist dies die allgemeine Plausibilität der Quelle, die Kompetenz des Autors,

Hinweise auf seriöse Institutionen oder Organisationen und der Hinweis auf Editoren

oder Review-Verfahren. Diese Merkmale lassen sich auch bei anderen netzexternen

Quellen anwenden. Eine Ausnahme macht hier nur das letzte

Glaubwürdigkeitsmerkmal, die Internet-Domain.

4.3.1.1 Allgemeine Plausibilität der Quelle

HARRIS (2000 : 60) und MEIER (1999b : 188 f.) empfehlen, sich erst einmal an der

allgemeinen Plausibilität der Information zu orientieren. Anhand einfacher

Leitfragen

kann man auf diese Weise auf eine gewisse innere „Stimmigkeit“ der Quelle schließen,

die zeigt, dass ein Autor sich ernsthaft mit dem jeweiligen Thema

auseinandergesetzt

hat.

Leitfragen:

- Existieren hinreichende Beweise für eine überzeugende Argumentation?
- Sind überzeugende Argumente und Gründe gegeben?
- Werden genügend Details für eine vernünftige Schlussfolgerung angegeben?
- Wird Fachvokabular richtig angewendet?
- Werden allgemein bekannte Sachverhalte, Probleme etc. richtig dargestellt?

4.3.1.2 Kompetenz des Autors

Die Frage nach dem Autor ist die zentrale Fragestellung bei einer Evaluation, da dieser für die Glaubwürdigkeit und Genauigkeit der Inhalte der Seite verantwortlich ist.

Erfahrung, Kompetenz und Verlässlichkeit des Autors lassen sich aus verschiedenen

Angaben schließen, die auf der Webseite zu finden sein sollten: Zum einen biografische

Informationen, wie beruflicher Werdegang, Titel, jetzige berufliche Position und

Arbeitgeber, zum anderen Kontaktmöglichkeiten via E-Mail, Telefon oder Post, die im

Zweifel auch genutzt werden sollten, um so auf einfache Art und Weise mehr Details

zu erfahren oder Unklarheiten beseitigen zu können (vgl. ALEXANDER/TATE 1999 :

11; COOKE 1999 : 60 f.; HARRIS 2000 : 61; KIRK 2001).

Wenn der Autor Mitglied einer allgemein bekannten und respektierten Organisation ist,

sollte dies auf der Webseite deutlich erkennbar sein, da dies automatisch zur

Qualitätssicherung beiträgt (s.a. folgendes Kapitel).

Als exemplarisches Beispiel sei hier die Eingangsseite der Homepage von Dr. Oliver

Obst genannt, der hier in kurzer Form alle wichtigen Angaben zu seiner Person zeigt (s.

Abb. 13).

Abb. 13: Ausschnitt der Eingangsseite von Dr. Oliver Obst (medweb.uni-muenster.de/obsto)
[Stand: 10.11.2001]

Sehr hilfreich kann auch das Wissen über die Reputation eines Autors unter Kollegen sein. Diese Angaben sind allerdings oft schwer zu erfahren. Gute Dienste können hierbei die schon erwähnten Organisationen wie „Quackwatch“ (www.quackwatch.com) und das „Center for Disease Control and Prevention (CDC)“ (www.cdc.gov) leisten. Sie führen Listen mit unseriösen Medizinern und Wissenschaftlern. Leider existieren solche Aufstellungen bisher nur im Bereich der Medizin.

Leitfragen:

*Erfährt man etwas über die Kompetenz des Autors?
Möglichkeiten der Kontaktaufnahme via E-Mail, Telefon etc. mit dem Autor?
Ist der Autor Mitglied in einer anerkannten Organisation/ Institution?
Wie ist die Reputation des Autors?
Veröffentlichungen des Autors auch in anerkannten Fachzeitschriften des Printbereiches?*

4.3.1.3 Hinweis auf Institution / Organisation

Viele Seiten im Internet haben ein Gegenstück im Bereich der Print- oder Fernsehmedien, wie z.B. die Zeitschrift „Der SPIEGEL“ und seine Online-Ausgabe „SPIEGEL Online“ (www.spiegel.de). Wenn die netzexterne Quelle als zuverlässig und vertrauenswürdig gilt, dann betrifft dies auch die entsprechende Website. Aus zwei Gründen ist dies der Fall: Zum einen muss die Website die Reputation der netzexternen Quelle aufrechterhalten, zum anderen wird das Online-Angebot aus denselben Ressourcen gespeist, d.h., dass Online-Redaktionen zumeist ihre Informationen aus den traditionellen Redaktionen bzw. denselben glaubwürdigen Quellen beziehen (vgl. NEUBERGER 2000 : 313 f.). Dasselbe gilt für Informationen, die auf Seiten von Universitäten oder von allgemein anerkannten und vertrauenswürdigen Organisationen liegen. (Vgl. COOKE 1999 : 60; HARRIS 2000 : 65, KIRK 2001)

Leitfragen:

*Ist die Webseite Ableger einer
Printausgabe?
Gehören die Seiten zu einer Universität oder anerkannten
Organisation?*

4.3.1.4 Hinweis auf Review- Verfahren

Wie schon erwähnt, müssen sich wissenschaftliche Artikel einem Review-Verfahren unterziehen, in dem Experten den Artikel untersuchen und überprüfen, um ihn dann erst zur Veröffentlichung freizugeben. Dieses Verfahren ist bei Texten im Internet bisher nur sehr selten anzutreffen (vgl. AMBRE et al. 1997 : 2-6; ALEXANDER/TATE 1999 : 12). Eine Ausnahme bildet das E-Journal „First Monday“ (www.firstmonday.org). Hier ist unter jedem veröffentlichten Artikel ein Hinweis des

Editors gegeben, wann der Text eingereicht, akzeptiert und überarbeitet wurde (s. Abb. 14).³³

Abb. 14: Ausschnitt eines Artikels aus dem E-Journal „First Monday“ (www.firstmonday.org)
[Stand:
10.11.2001]

Leitfragen:

*Werden die Texte von einem Editor oder einer Redaktion kontrolliert?
Unterliegt der Text einem anerkannten Review-Verfahren?*

4.3.1.5 Internet – Domain

Die Internetadresse einer Seite, auch „*Uniform Resource Locator (URL)*“ genannt, kann als Anhaltspunkt für Glaubwürdigkeit dienen. Eine URL wird durch drei Grundelemente gebildet (s. Abb. 15):

1. Protokollname :
„http://“
2. Hostname : „www.uni-muenster.de“
3. Verzeichnis- und Dateiname : „.../Soziologie/veranstaltungen/kvv_ws01.htm“

³³ Näheres zum Prozess des Review-Verfahrens von „First Monday“ unter <http://www.firstmonday.org/idea.html> [Stand: 28.10.2001].

Abb. 15: Beispiel zum Aufbau einer Internetadresse (URL) [Stand: 10.11.2001]

Entscheidend für die Glaubwürdigkeit sind der Hostname samt der Top-Level-Domain (TLD). Aus dem Hostnamen lässt sich oftmals direkt die Institution oder Organisation

ablesen, die den Web-Server betreibt, in diesem Falle die Universität Münster (s. Abb. 4.8). Und, wie oben bereits erwähnt, gilt: Wenn die Quelle auf einem Server einer glaubwürdigen Institution liegt, dann wird auch die Information als authentisch angesehen.

Auch die Top-Level-Domain kann Auskunft über die Glaubwürdigkeit von Quellen geben, denn neben den Länderkürzeln, wie z.B. „.de“ für Deutschland oder „.uk“ für Großbritannien, die bei der Evaluation nicht helfen, da sie keine Aussagekraft haben, existieren noch weitere TLDs, wie „.edu“ für Bildungseinrichtungen, „.gov“ für Regierungsstellen, „.mil“ für militärische Einrichtungen, „.net“ für Netzanbieter, „.org“ für nichtkommerzielle Organisationen und „.com“ für kommerzielle Anbieter.

³⁴ Diese

Domain-Bezeichnungen waren ursprünglich nur für den US-amerikanischen Raum bestimmt, werden aber mittlerweile weltweit genutzt. Die drei erstgenannten Top-Level Domains („.edu“, „.gov“ und „.mil“) werden nur an staatliche Organisationen vergeben und sind deshalb als autoritative Quellen für Wissenschaft und Forschung anzusehen, während „.net“ und „.com“ auf rein kommerzielle Anbieter hinweisen und deshalb mit Skepsis in Bezug auf die dargebotenen Informationen zu sehen sind. Schwierig ist es bei der Domain „.org“, da diese Endung sowohl von seriösen als auch unseriösen Institutionen getragen wird, so besitzen z.B. die „Vereinten Nationen“ die Adresse www.un.org, während das rechtsradikale „Institute for Historical Review“ ist unter www.ihr.org im Netz vertreten ist. (Vgl. GREER et al. 1999c; HENDERSON 2001)

³⁴ In diesem Kapitel werden die sieben neuen Top-Level-Domains (.aero / .biz / .coop / .info / .museum / .name / .pro) nicht berücksichtigt, da sie bisher so gut wie noch nicht im Internet in Erscheinung getreten sind und man deshalb zur Zeit noch keine näheren Aussagen über sie treffen kann. Informationen zu den neuen TLDs bei ICANN unter <http://www.icann.org/tlds/>. Ein Überblick über alle Top-Level-Domains bietet „Netplanet“ unter <http://www.netplanet.org/adressierung/-Domains1?sub=tld.html> [beide Stand: 02.11.2001] an.

Leitfragen:

*Welche Top-Level-Domain beinhaltet die Adresse?
Weist die Adresse auf eine Institution oder Organisation hin?*

4.3.1.6 Indikatoren für Glaubwürdigkeitsdefizite

Ein deutlicher Indikator für mangelnde Glaubwürdigkeit ist die Anonymität, das Fehlen jeglicher Angaben über den Autor oder die Herkunft der Quelle. Weitere Anzeichen sind die mangelnde Sicherung der Informationsqualität durch Reviews oder Editoren und negative Metainformationen, d.h. kritische Besprechungen der Quelle auf Seiten, wie „Argus Clearinghouse“ oder „SOSIG“. Auch auffallend viele Rechtschreib- und Grammatikfehler weisen auf eine ungläubwürdige Quelle hin, da wissenschaftliche Texte vor der Veröffentlichung, wie jeder andere Text eigentlich auch, nach formalen Aspekten untersucht werden. (Vgl. HARRIS 2000 : 62)

4.3.2 Genauigkeit und Abdeckung

Das Ziel von Genauigkeit und Abdeckung in einer Quelle ist, dass die Informationen tatsächlich heute aktuell, sachlich, ausführlich, genau und umfassend sind, so dass sich eine wahrheitsgemäße und unverzerrte Darstellung der Fakten ergibt.

4.3.2.1

Aktualität

Die Aktualität einer Webseite beinhaltet zwei verschiedene Faktoren: die Aktualität der eigentlichen Quelle und die Pflege und Instandhaltung der Seite. Aktualität stellt bei Webseiten oft ein Problem dar, weil man ihnen das Alter, im Gegensatz zu Büchern, die das Erscheinungsjahr im Impressum oder Vorwort führen, nicht auf Anhieb ansehen kann. Eine veraltete Information kann genauso nutzlos wie

63

eine ungenaue oder irreführende sein. Man sollte sich aber auch im klaren sein, welche Art von Information man sucht. „Alt“ bedeutet nicht gleich „schlecht“, da die Aktualität einer Quelle natürlich nicht immer eine Rolle spielt und somit nicht in jedem Fall wichtig sein muss. Manche Texte sind zeitlos, wie philosophische Schriften von Aristoteles oder auch die Werke von William Shakespeare, andere verlieren ihren Wert nur langsam, während Texte sehr schnell veralten, wenn es sich etwa um technologische oder medizinische Fakten handelt. So ist z.B. die sehr ausführliche

Bibliographie zum Thema „Computers in K-12 Education“

(pixel.cs.vt.edu/%7Ermohn/k12/edbib.html) nutzlos, da der neueste Eintrag aus dem Jahre 1994 stammt und somit völlig veraltet ist.

Bei der Aktualität kommt es sehr auf den thematischen Bezug an.

Nichtsdestotrotz sollte die Quelle das Alter der Information angeben und grundsätzlich nur zeitgemäße Angaben liefern. (Vgl. AMBRE et al. 1997 : 2-5 f.; COOKE 1999 : 63 f.;

ALEXANDER/TATE 1999 : 13 f.; HARRIS 2000 : 63)

Wenn es keine Angaben über die Häufigkeit und Regelmäßigkeit von Updates gibt, weist oft die Funktionstüchtigkeit sämtlicher auf der Seite befindlichen Links auf den

aktuellen Zustand hin (vgl. NIELSEN 1998a).

Leitfragen:

*Wie alt ist die Information und von wann stammt das letzte Update der Seite?
Wie häufig wird die Quelle einem Update unterzogen?
Funktionieren die Links?*

4.3.2.2 Genauigkeit der Quelle

Mit der Genauigkeit ist die faktische Exaktheit bzw. die Korrektheit einer Informationsquelle gemeint, wobei diese Einschätzung von zwei Faktoren abhängig ist, nämlich von der Natur der Information und vom Wissensstand des Evaluators. Während es in der Mathematik als Antwort in der Regel nur richtig oder falsch gibt, die Genauigkeit also eindeutig ist, existiert so eine Exaktheit bei Theorien insbesondere im geisteswissenschaftlichen Bereich nicht, da hier oft eine absolut richtige oder falsche

64

Antwort nicht möglich ist. Die Einschätzung der Genauigkeit kann der Evaluator

entweder anhand des eigenen Wissens oder aber mit Hilfe einer zusätzlichen Informationsquelle erreichen. (Vgl. COOKE 1999 : 61)

Wichtig für den Leser ist die Wahrnehmung der Genauigkeit der Quelle. Diese kann sich darin widerspiegeln, dass der Text durch Editoren geprüft oder durch Hinweise auf die Voreingenommenheit von Autor, Verleger oder Sponsor deutlich gemacht wurden.

Auch die formalen Aspekte, wie Rechtschreibung, Grammatik und Zeichensetzung sollten beachtet werden. (Vgl. ebd. : 61 f.)

Leitfragen:

*Um welche Art von Information handelt es sich?
Wurde die Quelle von Editoren, Redakteuren o.ä.*

*überprüft?
Existieren überdurchschnittlich viele formale
Fehler?*

4.3.2.3 Abdeckung des Themas

Die Abdeckung des Themas stellt einen der wesentlichen Faktoren bei der Bewertung nach der Nützlichkeit einer Quelle dar. Die wichtigsten Aspekte sind die Bandbreite, die sich aus der Anzahl der angesprochenen Themen ergibt, der Umfang der Abdeckung innerhalb einer Quelle und der Detailgrad einer Information, der die Tiefe der angesprochenen Themen in der Quelle wiedergibt. Zusätzlich kann auch die zeitlich rückwirkende Abdeckung eines Themas die Nützlichkeit beeinflussen, also ein Thema

nur den jetzt aktuellen Forschungsstand präsentiert oder aber die gesamte Entwicklung eines Forschungsgegenstandes. Durch all diese Faktoren entsteht ein Bild über die Vollständigkeit der Quelle. (Vgl. ALEXANDER / TATE 1999 : 14; COOKE 1999 : 54 f.)

Doch kein Thema kann wirklich komplett abgedeckt werden, dafür erscheinen zu viele Bücher, Fachzeitschriften etc.. Um jedoch kein falsches Bild aufkommenzulassen, dürfen nicht absichtlich Fakten oder Daten ausgelassen werden. Deshalb ist es auch

hier wichtig, auf eine möglichst große und „vollständige“ Sammlung von Quellenangabe zu achten. (Vgl. HARRIS 2000 : 63 f.)
Wie unterschiedlich die Abdeckung eines Themas sein kann, soll am Beispiel „Holocaust“ kurz erläutert werden. Die Website „Shoa.de“ (www.shoa.de/) bearbeitet dieses Thema sehr umfassend. Die Informationspalette reicht von allgemeinen Informationen zum Thema „Antisemitismus“ bis hin zu Artikeln über

einzelne
Personen, wie z.B. Anne Frank. Hinzu kommt eine umfangreiche Bibliographie
und
Linksammlung, die durch eine Quellensammlung, welche sowohl Video- als
auch
Audioquellen umfasst, abgerundet wird. Das genaue Gegenteil dieser Site stellt
die
private Homepage von Arthur R. Butz (pubweb.acns.nwu.edu/abutz/) dar. Diese Seite

beinhaltet kaum Informationen zum Thema und die wenigen Angaben sind auch
noch
falsch, da er als Revisionist den Holocaust
verneint.

Leitfragen:

*Wie groß ist die Bandbreite des
Themas?
Wie weit wird ins Detail
gegangen?
Wird das Thema umfassend
behandelt?
Existieren Hinweise zu anderen Quellen (Literatur, Links etc.)?*

4.3.2.4 Absicht und Zielgruppe

Da die Genauigkeit einer Quelle auch die unverzerrte Darstellung von
Informationen
umfasst, sind Fragen nach der Absicht und der Zielgruppe
wichtig.
Die Quelle kann in ihrer Absicht sehr unterschiedlichen Beweggründen folgen.
Sie
kann z.B. politisch oder kommerziell motiviert sein und somit ein nicht objektives
Bild
vermitteln. Formulierungen über Absichten und Ziele einer Quelle befinden
sich
zumeist auf einer Website unter Punkten wie „About Us“ oder FAQ (Frequently
Asked
Questions).

Wie wichtig es ist, die Beweggründe zu kennen, verdeutlicht die „Zündelsite“ (www.zundelsite.org) als Beispiel für eine politisch motivierte Seite. Hier wird die rechtsradikale Einstellung der Autoren in der Einleitung zur Webseite sehr deutlich:

“The Zündelsite documents will chip away at a World War II propaganda monstrosity - the so-called "Holocaust". The Zündelsite web pages will prove in many different ways - statistically, forensically, and logically - that it is historically inaccurate, ~~emotionally~~ and cruelly unfair to claim the "Holocaust" took place in the form portrayed by conventional media.” (www.zundelsite.org/english/misc/mission.html)

Durch die Absicht wird auch die Zielgruppe definiert. Die Identifizierung der in der Quelle angesprochenen Zielgruppe ist wichtig, da der User feststellen muss, ob die Informationen auf einem für ihn passenden Wissensstand präsentiert werden oder nicht.

(Vgl. AMBRE et al. 2-9 f. ; COOKE 1999 : 53; HARRIS 2000 : 64)

Ein weiteres Beispiel ist die Website „OncoLink“ der Universität Pennsylvania, die in ihrer Rubrik „About Oncolink“ (www.oncolink.com/templates/about/index.cfm) sowohl die Ziele als auch die Zielgruppe genau definiert (s. Abb. 16).

Abb. 16: Ausschnitt aus der Webseite „OncoLink“ (www.oncolink.com/templates/about/index.cfm).

[Stand:
10.11.2001]

Leitfragen:

*Welches sind die Ziele und Absichten der
Quelle?
Werden diese vom Autor in einem FAQ o.ä. deutlich
gemacht?
Für wen ist diese Seite gemacht? (Schüler/Studenten/Experten/etc.)*

4.3.2.5 Indikatoren für mangelnde Genauigkeit und Abdeckung

Indikatoren für mangelnde Genauigkeit und Abdeckung einer Quelle sind das Fehlen des Datums auf einem Dokument oder ein überholtes Datum eines Themas, von dem allgemein bekannt ist, dass sich die Erkenntnisse ständig ändern. Weitere Indizien für Mängel sind Behauptungen, die vage sind oder denen es an Details fehlt, unqualifizierte Ausdrücke, eine einseitige und voreingenommene Betrachtung des Themas und das Fehlen neuer Erkenntnisse. Des Weiteren eine mangelnde Pflege der Webseite, die sich in „toten“ Links oder „Under Construction“-Seiten ausdrückt. (Vgl. HARRIS 2000 : 64)

4.3.3 Ausgewogenheit

Das Ziel von Ausgewogenheit ist es, dass die Quelle ihr Thema überlegt und sachgemäß präsentiert. Außerdem sollte ein ausgewogener Text um die Wahrheit bemüht sein. (Vgl. DEBATIN 1998; HARRIS 2000 : 70)

4.3.3.1 Objektivität

Eine absolute Objektivität gibt es nicht, aber ein Autor sollte seine Voreingenommenheit kontrollieren können, die Argumente sollten ausgeglichen und begründet sein. Das größte Problem hierbei ist der Konflikt mit dem eigenen Interesse.

Viele Quellen haben ein finanzielles, politisches, emotionales oder psychologisches Interesse, einen glauben zu machen, dass sie allein die Wahrheit vertreten. Die

Objektivität lässt sich meistens schon an der Art und Weise des Tonfalls erkennen. Der

68

Stil muss sachlich und darf nicht manipulativ oder emotional sein. (Vgl. AMBRE et al.

1997 : 2-5 ; ALEXANDER/TATE 1999 : 13; HARRIS 2000 : 64 f., KIRK 2001)

Ein Beispiel für finanzielles Eigeninteresse zeigt Dr. Allen Buresz in seinem Artikel

„Attention Deficit Disorder & Hyperactivity Success“ (www.all-natural.com/add.html).

Hier weist er mit Hilfe wissenschaftlicher Studien auf die erfolgreiche Behandlung von

ADHS (Aufmerksamkeitsdefizit-/Hyperaktivitäts-Syndrom) durch natürliche

Nahrungsergänzungsmittel anstelle von Medikamenten hin. Die Objektivität ist deshalb

anzuzweifeln, da diese Nahrungsergänzungen gleichzeitig auf der Website bestellt

werden können und so ein eindeutiges finanzielles Interesse besteht. Ein objektiver

Artikel zu diesem Thema wäre z.B. „ADHS: Das Zappel-Philipp-Syndrom“ von Astrid

Deilmann aus dem Magazin „GEO“ (www.geo.de/themen/medizin_psychologie/-

adhs/index.

html).

Leitfragen:

Hat der Autor ein politisches, religiöser, kommerzielles o.ä.

Interesse?

Ist der Tonfall im Text eher sachlich oder

emotional?

Werden rhetorische Stil- und Manipulationsmittel eingesetzt?

**4.3.3.2
Folgerichtigkeit**

Eine Information sollte nicht nur objektiv, sondern auch folgerichtig sein, denn nur dann kann man diese als ausgewogen bezeichnen. Diese Folgerichtigkeit ergibt sich aus einer geradlinigen Argumentation, in der keine Widersprüche auftauchen, so dass sich ein klarer thematischer Zusammenhang ergibt. Es darf innerhalb des Textes auch nicht zu einer Verdrehung von Tatsachen oder falschen Schlussfolgerungen kommen, so dass Unwahrheiten entstehen (vgl. HARRIS 2000 : 66).

Leitfragen:

*Ist die Argumentation widersprüchlich?
Kommt es zur Verdrehung von Tatsachen?
Werden Fakten falsch bewertet oder interpretiert?*

4.3.3.3 Indikatoren für mangelnde Ausgewogenheit

Der Tonfall in einer Quelle ist beim Erkennen der Ausgewogenheit ein wichtiger

Indikator. Ein Mangel ist zu erkennen, wenn der Autor aus eigenem Interesse sehr emotional schreibt und stark über- oder untertreibt und somit nicht mehr objektiv bleibt. Desweiteren müssen die Zusammenhänge in der Information einer klaren

Argumentation folgen und in sich logisch und schlüssig sein. (Vgl. HARRIS 2000 : 66 f.)

4.3.4

Quellennachweise

Der Aspekt „Quellennachweis“ beinhaltet die direkten Kontaktmöglichkeiten mit dem Autor, ein Quellenverzeichnis und die Bestätigung der Quelle durch andere Ressourcen. Das Ziel der Nachweise ist, dass die Quelle belegbare Informationen enthält, die glaubwürdig und nachvollziehbar sind, denn nur dann kann sie Geltungsansprüche für den Wahrheitsgehalt einfordern.

4.3.4.1

Kontaktmöglichkeiten

Wie auch schon bei der Glaubwürdigkeit (s. Kapitel 4.3.1.2) spielt auch hier die Möglichkeit der direkten Kontaktaufnahme mit dem Autor eine wichtige Rolle. E-Mail Adresse, Postanschrift, Telefonnummer oder Anschrift der Institution sollten angegeben sein, da anonyme Quellen unseriös sind und unglaubhaft wirken.

Kann man den Autor per E-Mail, Telefon oder Post erreichen?

4.3.4.2

Quellenverzeichnis

Egal, ob es sich um eine Internet- oder Printquelle handelt, ein Quellenverzeichnis ist immer elementarer Bestandteil des Textes. Nur hierdurch wird ein Text beleg- und nachweisbar, so dass er zuverlässig, glaub- und vertrauenswürdig wird. Das Verzeichnis sollte gleichermaßen aus Print- und Online-Quellen bestehen. Links haben den Vorteil, dass der User schnellstmöglich zusätzliche Informationen findet. Hierbei muss allerdings verhindert werden, dass er sich im Netz verliert, da ein User nach etwa drei Hyperlinks vergisst, wo er davor gewesen ist (HOFER / ZIMMERMANN² 2000 : 29). Deshalb sollten externe Links als kenntlichgemacht werden. Zudem ist eine Kommentierung der Links sinnvoll, damit der User weiß, welche Informationen er über diese noch zusätzlich erreichen kann (vgl. AMBRE et al. 1997 : 2-11 f.).

Leitfragen:

Existieren Hinweise zu anderen Quellen (Literatur, Links etc.)?

Sind diese kommentiert?

Nach welchen Kriterien sind diese ausgewählt?

Sind die zitierten Quellen populär- oder fachwissenschaftlich orientiert?

4.3.4.3 Bestätigung durch Dritte

Eine Bestätigung durch Dritte kann insbesondere dann wichtig sein, wenn die Quelle wichtige Informationen enthält, die aber nicht allen Evaluationskriterien standhält. Dann muss die Information mit Hilfe anderer Quellen auf ihren Wahrheitsgehalt geprüft werden. Erst wenn mindestens zwei weitere Quellen mit den gefundenen Informationen übereinstimmen, kann die Information als glaubwürdig betrachtet werden. Wichtig hierbei zu beachten ist, dass die Kontrollquellen entweder von neutralen Dritten stammen, d.h. die Quellen nicht genauso beeinflusst sind, wie die zu untersuchende, oder aber positiv bei Review-Diensten wie „Argus Clearinghouse“ oder Portalen wie „SOSIG“ bewertet werden. (Vgl. ² 1999b : 188; HARRIS MEIER 2000 : 68)

Auch eine Besprechung in anderen Medien, z.B. einer renommierten Zeitschrift, kann eine Bestätigung darstellen.

Leitfragen:

*Wird die Quelle auf anderen Seiten verlinkt ?
Gibt es Kommentare zu der Quelle (im WWW, in Zeitschriften etc.)?*

4.3.4.4 Indikatoren für mangelnde Quellennachweise

Quellen sind nur dann für den User nützlich, wenn sie belegbare Informationen enthalten, die durch Nachweise aus dem Internet oder den Printmedien gestützt werden. Deshalb sind Informationen ohne jegliche Quellennachweise für den wissenschaftlichen Gebrauch nicht von Nutzen. Dieser Mangel drückt sich in fehlenden Literaturverzeichnissen, Linksammlungen oder Kontaktmöglichkeiten aus. Die

Quelle ist ebenso mit Skepsis zu betrachten, wenn überhaupt keine Bestätigung durch Dritte, in Form von Zeitschriften- oder Online-Reviews, vorliegt.

4.3.5 Benutzerfreundlichkeit

Jakob NIELSEN schreibt in seiner Kolumne „Alertbox“ (www.useit.com/alertbox/):

„*The Web is all about content.*“ (1998b), dieser Leitspruch gilt auch für die Evaluation von Online-Quellen. Der Inhalt ist der primäre Faktor. Webspezifische Eigenschaften, wie Benutzerfreundlichkeit, Struktur, Zugang und multimediale Darbietung sind sekundär, da die User an den Informationen interessiert sind, egal auf welche Art und Weise diese präsentiert werden. Hinzu kommt, dass die optische und funktionelle Gestaltung subjektiv ist und vom persönlichen Empfinden („*Look and Feel*“) des einzelnen bestimmt wird. Eine Bewertung dieser Faktoren hängt deshalb vom individuellen Gesamteindruck der Seite ab. Dieser Punkt ist aber insofern wichtig, da

eine gute Präsentation und klare Struktur dem User bei Suche, Auffinden, Anwenden und Verstehen der Informationen hilfreich sein kann. Hierbei gilt der Leitspruch der Bauhausarchitekten: „*Form follows Function*“, d.h. es wird erst der Zweck und die Funktion der Website definiert und daran die gestalterische Umsetzung angelehnt. Der Spruch wird im Bereich des Webdesign oft sogar noch, um die Bedürfnisse und Ansprüche des Websurfers, erweitert: „*Form follows Function follows User Demands.*“ (Vgl. McKELVEY 1999 : 11 ff.)

4.3.5.1 Struktur und Navigation

Für die Navigation auf einer Webseite existieren verschiedene Möglichkeiten:
 Site
 Maps, Inhaltsverzeichnisse, Menüs oder seiteninterne Suchmaschinen. Diese Features
 helfen einem dem User, die gewünschte Information zu finden, und zum
 anderen
 verschaffen sie einen Überblick über die Bandbreite der Informationen auf
 einer
 Website. Der Evaluator sollte alle Möglichkeiten des Auffindens von
 Informationen
 testen, um so die Effektivität der Seite zu bewerten, indem die Anzahl der Schritte
 bzw.
 „clicks“ bis zur benötigten Information gezählt werden. Geachtet werden sollte
 auch
 auf Kategorisierungen, also ob Themenbereiche sinnvoll zusammengefasst worden
 sind
 und ob es Shortcuts gibt (vgl. AMBRE et al. 1997 : 2-14; McKELVEY 1999 : 11 f.;

HOFER / ²2000 : 98
 ZIMMERMANN f.).

Aber allein schon die Präsentation und Anordnung der Information kann dem
 User
 helfen, die gewünschte Information zu finden, wie z.B. ein klares, ästhetisches
 und
 übersichtliches Screendesign, nicht zu viele verschiedene Informationen auf einer
 Seite
 und leicht verständliche Überschriften. Exemplarisch seien hier die Startseiten
 der
 Zeitschriften „GEO“ (Abb. 17) und „Scientific American“ (Abb. 18) verglichen.
 Die
 „GEO“-Seite lässt sich grob in drei Sektionen unterteilen: die Navigationszeile auf der
 linken Seite, aktuelle Nachrichten in der zentralen Spalte und Eigenwerbung
 und
 Hinweise auf der rechten Seite. Unterstützt wird das Layout durch die
 einfache
 Farbgebung (schwarz/weiß/grün), so dass ein sehr klares und übersichtliches
 Design
 entsteht. Anders ist dies bei der Seite von „Scientific American“, die sich in
 fünf
 Bereiche (von links nach rechts) untergliedern lässt: die Navigationszeile, aktuelle
 Nachrichten, Fragen und Antworten mit einer Umfrage, wieder eine
 Navigationszeile
 und Hinweise, Eigenwerbung. Aufgrund dieser Aufteilung und der vielen
 Überschriften
 wirkt die Seite unübersichtlich, was durch die bunte Farbgebung noch gesteigert
 wird.

Abb. 17: Ausschnitt der Startseite der Zeitschrift „GEO“ (www.geo.de) [Stand: 10.11.2001]

Abb. 18: Ausschnitt der Startseite der Zeitschrift „Scientific American“ (www.sciam.com)
[Stand: 10.11.2001]

Aber auch die Navigation innerhalb einer Seite sollte bewertet werden. Extrem

lange
Seiten, bei denen der User viel scrollen muss, werden meist negativ bewertet, da
lange
Texte am Bildschirm schlecht zu lesen sind. Untersuchungen haben ergeben, dass
nur
10% der User Seiten scrollen (vgl. HOFER /
ZIMMERMANN
Umfangreiche Texte, die in kurze Sektionen unterteilt werden, so dass
kurze,
überschaubare Seiten entstehen, die sich per Mausklick „umblättern“ lassen,
werden
eher bevorzugt (vgl. COOKE 1999 : 72; HOFER /
ZIMMERMANN
f.).

²2000 :
98).

²2000 : 35 und
65

Leitfragen:

*Wie schnell lassen sich gesuchte Informationen
finden?
Gibt es Site Maps, Navigationshilfen oder
Suchmöglichkeiten?
Werden die Informationen klar und deutlich
präsentiert?
Wie überschaubar sind die
Seiten?*

4.3.5.2 Zugang

Der Zugang beeinflusst die Wahl einer Informationsquelle nicht unerheblich. Das Internet wird oft zur Informationssuche benutzt, da es dank vernetzter Computer mit Bedieneroberflächen sehr bequem ist. Dieser Weg ist schneller und leichter als der Gang zur Bibliothek. Zudem sind die meisten Informationen im Internet, im Gegensatz zu professionellen Datenbanken beispielsweise, kostenlos. Die User wollen also grundsätzlich einen einfachen, kostengünstigen und schnellen Zugang zu Informationen. Aber auch dies ist im Internet nicht immer gewährleistet, da verschiedene Faktoren die Bequemlichkeit des Zugriffs erschweren.

- **Allgemeine
Zugangsschwierigkeiten**

Der Zugang zu Informationen kann durch Sprache, Registrierung, Passwort oder Mitgliedschaft erschwert werden. Die erste Hürde stellt häufig die Sprache dar, denn ca. 78% aller Webseiten und sogar ca. 96% der E-Commerce-Seiten sind englischsprachig, aber nur 50% der User haben Englisch als Muttersprache (vgl. LYMANN/VARIAN 2001a). Eine weitere Hürde stellt die Registrierung dar. Viele Webseiten, insbesondere

Zeitschriften, geben nur einen Teil der Seiten frei. Erst nachdem der User sich registriert hat, wird der komplette Inhalt preisgegeben. Das Problem bei der Registrierung ist, dass dafür persönliche Daten (Name, Adresse, Geburtsdatum etc.) angegeben werden müssen, die zum Teil dann an Dritte weitergegeben werden, oder dass durch die Registrierung Kosten entstehen (s.u. Kapitel „Kosten“). Gleiches gilt für die Zugangsbeschränkung durch Passwörter oder Mitgliedschaften. (Vgl. COOKE 1999 : 67 f.)

Leitfragen:

*In welcher Sprache ist die Website verfasst?
Muttersprache?
Gibt es eine Übersetzung der Seite? Zwei- oder
mehrsprachig?
Muss man sich registrieren, um an die Informationen zu
gelangen?*

- **Zugriffsgeschwindigkeit**

Die Geschwindigkeit des Zugriffs auf Informationen kann durch viele Gründe gebremst werden. Das kann zum einen an der Technik liegen. Es kommt auf die eigene technische Ausstattung an, wie Modem, analoger oder digitaler Anschluss etc., oder aber auf die der Gegenseite, wo die entsprechende Information liegt. Durch langsame

Server und geringe Bandbreite kann es zu Verzögerungen unterschiedlicher Stärke

kommen. Um das Problem in den Griff zu bekommen, haben inzwischen viele Suchmaschinen und Portale Mirror-Sites angelegt, so dass der Zugriff auf lokale, länderspezifische Server erfolgen kann.

Es kann aber auch an der schlechten Gestaltung der Webseiten liegen, die zu viele und große Bilder enthalten und dadurch eine lange Ladezeit benötigen.

Studienergebnisse belegen, dass ein User im Durchschnitt nicht länger als acht Sekunden auf den Aufbau

einer Seiten wartet (vgl. HOFER / ZIMMERMANN² 2000 : 99). Um dieses Problem zu

umgehen, benutzen viele Seiten inzwischen Thumbnails, dies sind kleine

Vorschaubilder, die sich erst beim Anklicken vergrößern, oder aber auch alternative

„Text-Only“ Seiten, die komplett ohne Grafiken auskommen. So bietet z.B. die

deutsche Suchmaschine „Fireball.de“ (www.fireball.de) unter der Internet-Adresse

<http://www.fireball.de/express.t.html> ein Interface ohne Grafiken und

Werbeeinblendungen an. (Vgl. ALEXANDER / TATE 1999 : 16; COOKE 1999 :

66
f.)

Leitfragen:

*Wie schnell ist der Zugriff auf den
Server ?
Bauen sich die Seiten schnell*

auf?
Gibt es eine rein textbasierte
Alternative?
Wird die Website gespiegelt (Mirror-Server)?

- **Einschränkungen durch Software**

Aber nicht nur die Hardware kann eine Problemquelle für den schnellen und einfachen Zugriff auf Informationen sein, sondern auch die Software. Dies beginnt schon bei der Wahl der Browser-Software, da der „Netscape Communicator“, der „Microsoft Internet

Explorer“ und andere Browser nicht alle den gleichen Standards folgen, so dass immer Probleme bei der Darstellung bestimmter Seiten auftreten können.

Bei Ausnutzung aller multimedialer Möglichkeiten im Netz kommt das Problem der Plug-Ins zum Tragen, da es unzählige Formate zur Übertragung von Layout-, Audio- und Videodaten gibt und ebenso viele Programme existieren, die diese anzeigen und

abspielen können. Da aber die Internetbrowser nur einen geringen Teil dieser Formate standardmäßig anzeigen können, werden entsprechende Plug-Ins benötigt, die herunterzuladen und zu installieren sind. Deshalb ist es wichtig, dass ein entsprechender Hinweis gegeben ist, wo man die entsprechende Software bekommt und wie man sie einsetzt. (Vgl. COOKE 1999 : 67; SCHROCK 1998)

Leitfragen:

*Sind die Seiten mit jedem Browser problemlos
Wird ein Plug-In zur Darstellung bestimmter Inhalte
benötigt?
Werden Standard Plug-Ins (Flash, Quicktime o.ä.) oder eher „Exoten“
genutzt?*

- **Kosten**

Evaluatoren müssen feststellen, ob die Informationen frei zugänglich sind oder ob Kosten für die Benutzung der Quelle entstehen (vgl. SMITH 1997; COOKE 1999 : 69). Viele Zeitschriften, wie z.B. „Bild der Wissenschaft“ (www.wissenschaft.de), „The Lancet“ (www.lancet.com) oder „Science“ (www.sciencemag.org), erstellen kurze Zusammenfassungen ihrer Artikel und bringen nur wenige im Volltext. „Nature“ dagegen bietet verschiedene Möglichkeiten an, die Zeitschrift über das Internet im Volltext zu lesen. Erstens ist die Website für alle Abonnenten der Printausgabe

78

freigeschaltet, zweitens gibt es die Möglichkeit, einzelne Artikel zu kaufen, wobei hier die Kosten zwischen 15.- und 25.- US-\$ pro Artikel liegen.

³⁵ Universitäten
und

Bibliotheken können Lizenzen für den freien Zugang kaufen (s. Abb. 19).

Abb. 19: Ausschnitt der Registrierungsseite der Zeitschrift „Nature“ (www.nature.com)
[Stand: 10.11.2001]

Leitfragen:

*Sind die Informationen
kostenfrei ?
Stimmt das Preis-
Leistungsverhältnis?
Welche Bedingungen müssen erfüllt werden, um an die
kostenpflichtigen
Informationen zu
gelangen?*

³⁵ Übersicht der Kosten von „Nature“-Artikeln unter http://www.nature.com/help/purchasing_online/pricing_policy.html. [Stand: 03.11.2001]

4.3.5.3 Ausnutzung interaktiver und multimedialer Möglichkeiten

Wie eingangs erwähnt, ist der Inhalt das entscheidende Kriterium bei der Evaluation.
Aber insbesondere interaktive und multimediale Features können dem User beim

Verstehen und Anwenden von Informationen unterstützen. Diese vielfältigen Möglichkeiten bietet außer dem Web kein anderes Medium. Weiterhin spielen Bilder eine immer größere Rolle in der Bildung und Wissenschaft. William J. T. MITCHELL spricht sogar von einem *“Pictorial Turn”*, der einen Paradigmenwechsel von der schrift- zur bildorientierten Wissensvermittlung einläutet (vgl. MAAR 2000 : 11 f., MITCHELL 2000 : 206 f.).

- **Interaktive Möglichkeiten**

Das Internet ist eine Kommunikationsplattform, auf der viele Leute miteinander kommunizieren und Meinungen und Gedanken austauschen können. Diese Möglichkeit sollte von Webseiten genutzt und bei der Evaluation berücksichtigt werden, da die Kommentare zu Themen oder der Website allgemein bei der Bewertung von Glaubwürdigkeit oder Genauigkeit helfen können. Die Mittel hierzu sind Messageboards, wie sie z.B. die Zeitschrift „Telepolis“ (www.telepolis.de) anbietet, die es dem User erlauben, zu jedem Artikel seinen Kommentar abzugeben, der dann direkt unter dem Artikel erscheint oder Diskussionsforen, in denen aktuelle Themen diskutiert werden, so z.B. bei „National Geographic“ (www.nationalgeographic.com/community/forums.html) oder „GEO“ (www.geo.de/interaktiv/index.html) oder Chatrooms, wo ein direktes Gespräch in Echtzeit mit einem Experten oder zwischen Usern untereinander geführt werden kann. (vgl. AMBRE 1997 : 2-14 f.)

- **Multimediale Möglichkeiten**

Einer der großen Vorteile von Internetseiten gegenüber Printmedien ist der Einsatz von Tönen (Abb. 20 a), Videos (Abb. 20 b), räumlichen, dreidimensionalen Darstellungen (Abb. 20 c) und Animationen (Abb. 20 d). Durch diese audio-visuellen Möglichkeiten

können Informationen aufgewertet und somit Themen besser und oft auch einfacher erläutert werden.

Audio

Video

Abb. 20 a: Historische Reden von Martin Luther King, Jr. (www.archervalerie.com/mlk.html)

Abb. 20 b: Video Archiv der NASA (www.nasa.gov/gallery/video/index.html)

VRML

Animation

Abb. 20 c: VRML-Darstellung einer Ameise (www.ento.vt.edu/sharov/3d/ant.wrl)

Abb. 20 d: Flash-Animation einer DNA - Replikation (www.hschockor.de/dnarepli.html)

Leitfragen:

*Gibt es Möglichkeiten, eigene Kommentare zu Themen zu veröffentlichen?
Werden die Informationen durch Bilder, Animationen, Audio- oder Videoaufnahmen*

unterstützt?

4.3.5.4 Indikatoren für mangelnde Benutzerfreundlichkeit

Ein Mangel an Benutzerfreundlichkeit zeigt sich, wenn die gestalterischen und technischen Möglichkeiten einer Website gar nicht genutzt werden, und die Seite zu einer grauen „Textwüste“ verkommt. Im Gegensatz dazu führt aber auch eine übertriebene Verwendung dieser Mittel schnell zu diesem Resultat, denn dann wird die Seite oft unübersichtlich und langsam im Seitenaufbau. Weitere Indikatoren mangelnder Benutzerfreundlichkeit sind u.a. eine Zwangsregistrierung für den Zugang, keine Auswahlmöglichkeit der Sprache, schlechte Seitendarstellung durch bestimmte Browsertypen und keine Möglichkeit mit dem Autor zu interagieren.

4.3.6 Einschätzung der Gesamtqualität

Der letzte Schritt der Evaluation beinhaltet die abschließende Bewertung der Quelle. Hierzu muss vorher ein Vergleich mit anderen Quellen erfolgen, um so die Qualität in Relation zu setzen. Der Vergleich sollte anhand der aufgeführten Evaluationskriterien durchgeführt werden (vgl. BRANDT 1996; COOKE 1999 : 80). Wichtig bei diesen Vergleichen sind auch die Fragen nach den Kosten, dem Wert in Bezug auf andere Medien und der Einzigartigkeit. Evaluatoren sollten, da nicht alle Informationen im Internet kostenfrei sind (s. Kapitel 4.3.5.2), immer den Kosten-Nutzen-Faktor berücksichtigen.

Insbesondere bei Zeitschriften im Internet sollte zudem ein Vergleich mit dem Print durchgeföhrt werden. Die elektronische Variante hat u.a. die Vorteile der direkten Kommunikation via E-Mail mit der Redaktion oder auch der einfachen Suche nach Artikeln in Archiven. Für die Papierversion spricht u.a. die einfachere Lesbarkeit, verglichen mit dem Lesen am Monitor (vgl. COOKE 1999 : 82).

Ein weiterer wichtiger Faktor bei dem Vergleich ist die Einzigartigkeit einer

Information oder Quelle. Entweder ist die Quelle so ausführlich, dass sie alle anderen bei weitem übertrifft, oder aber sie bietet ein einzigartiges Feature an, so z.B. die Website des „Visible Human Project“ (www.nlm.nih.gov/research/visible/-

visible_human.html), die Bilder und Videos eines Querschnitts durch den gesamten

menschlichen Körper anbietet (vgl. SMITH 1997; COOKE 1999 : 82).

Nachdem auch diese letzten Schritte vollzogen worden sind, kann sich der Evaluator nun endgültig ein Gesamtbild der Quelle machen und den Wert und die Nützlichkeit ermitteln. Durch seine eigene Erfahrung und die Anwendung der Kriterien ist es ihm möglich, Websites verschiedener Kategorien entsprechenden Wertigkeiten zuzuordnen. Diese Abstufung kann z.B. von sehr gut“ oder „sehr informativ“ bis hin zu „schlecht“ oder „nutzlos“ gehen.

Leitfragen:

*Welche Qualität besitzt die Quelle im Vergleich zu anderen Quellen?
Bei Zeitschriften: Besitzt die Webseite Vorteile zur Printausgabe?
Beinhaltet die Quelle einzigartige Informationen?*

5. Resümee

Digitale Weltbibliothek, Datenautobahn, Cyberspace, Weltwissen online, Hyperspace, globales Gehirn und Docuverse sind nur einige der Metaphern, die zur Zeit für das Internet benutzt werden. Sie zeugen von den angeblich unbegrenzten Möglichkeiten im Netz, von der riesigen globalen Bibliothek, die das Wissen der Menschheit enthält. Dieser Datenpool von Informationen wird inzwischen von 27,3 Millionen Deutschen genutzt, von 11,3 Millionen sogar täglich (vgl. SCHMITT-WALTER 2001).

Die Probleme, die diese Informationsflut mit sich bringt, werden dabei häufig übersehen. Zwei eigentlich gegensätzliche Bedrohungen stehen im Vordergrund: Erstens gibt es aufgrund der dezentralen Struktur des Internet keine Kontrollinstanzen, die die Inhalte auf den Wahrheitsgehalt überprüfen. Somit sind Propaganda, Fehlinformationen Tür und Tor geöffnet. Zweitens wird das Internet durch die wachsende Kommerzialisierung immer stärker von Industrie- und Medienkonzernen kontrolliert, dadurch gelangen nur noch von ihnen gefilterte Informationen zum

Websurfer. (Vgl. GOLDMANN 1999 : 22)

Diese Problematik ist aber nur den wenigsten Usern wirklich bewusst. In unserem Alltag benutzen wir eine Fülle von Medien. Das Spektrum beinhaltet Fernsehen, Zeitungen, Zeitschriften, Radio, Comics, Flugblätter usw.. Durch diesen täglichen Umgang haben wir zwischen Werbung und Nachrichten zu unterscheiden gelernt. Die Kompetenz, Quellen zu selektieren und zu bewerten, haben wir zum großen Teil unbewusst erworben, sie ist ein Aspekt unseres Alltagswissens. Wir haben gelernt, bestimmten Quellen mehr als anderen zu vertrauen, da wir wissen, dass es

kontrollierende und korrigierende Instanzen in der „offline“ Medienwelt gibt. In der digitalen Online-Welt ist die Situation aber ungleich komplizierter, so dass die

Bewertungsmechanismen zum Teil nicht mehr greifen. Da das Internet beginnt, einen immer höheren Stellenwert in der Medienwelt einzunehmen, ist es umso wichtiger, sich mit Evaluationskriterien von Online-Quellen zu beschäftigen.

Der bisherige Schulungsansatz durch Kurse an Schulen und Universitäten oder mit

Hilfe von Internet-Büchern und -Zeitschriften beschränkte sich meist auf technische

Aspekte des Internet, wie die Bedienung von Internet-Browsern, den Umgang mit

Suchmaschinen oder die Installation von Modems oder ISDN-Karten. Auch

beim Webdesign geht es meist vorrangig um die optische und technische Umsetzung einer

denachlässigt. Aber nur durch die Auseinandersetzung mit diesen Themen kann der Websurfer zum „*mündigen Netzbürger*“ (GOLDMANN 1999 : 22) werden. Deshalb fordert Paul GILSTER:

„*We need to set up content evaluation as part of the intellectual superstructure here and explain it to kids ... so we end up with students who can use the Web intelligently when to cast grave doubt on a particular Website. People have to be their editors and take that upon themselves. Once you begin doing that, the habits become second nature.*“ (zitiert nach KELLEY 1999)

Virtuelle Bibliotheken und Review-Dienste können dem Websurfer aufgrund der Informationsflut nur bedingt bei der Selektion und Bewertung von Webseiten weiterhelfen. Aus diesem Grund ist der User auf die Erlangung von Medienkompetenz

angewiesen, wobei die Evaluation von Webseiten nur einen Aspekt darstellt, um den sicheren Umgang mit glaubwürdigen und unglaubwürdigen Dokumenten zu erlernen. Dabei sollen die in dieser Arbeit genannten Aspekte der Evaluation in der Praxis helfen:

An erster Stelle steht hierbei die Glaubwürdigkeit, da sie den wichtigsten Faktor für die Informationsqualität darstellt. Hier wird die Plausibilität der Quelle, die Kompetenz des Autors, die Zugehörigkeit zu Institutionen und Organisationen und das Vorhandensein von Review-Verfahren überprüft. Hinzu kommt noch die Untersuchung des webspezifischen Merkmals der Internet-Domain. Zweitens wird die Genauigkeit und die Abdeckung der Online-Quelle getestet. Dies hat zum Ziel zu sehen, ob das Thema aktuell, genau, ausführlich und umfassend behandelt wird. Außerdem wird noch nach der Absicht und der Zielgruppe der Website gefragt. Hierauf folgt drittens die Bewertung der Objektivität und Folgerichtigkeit, um festzustellen, ob die Informationen sachgemäß und unverfälscht präsentiert werden. Punkt vier der Evaluation beinhaltet die Quellennachweise, denn nur dadurch kann der Text den Wahrheitsgehalt der dargebotenen Informationen beweisbar und nachvollziehbar machen. Dieses Verzeichnis sollte sowohl Printpublikationen als auch Internet-Links umfassen. Eine Bestätigung durch Dritte, etwa eines Review-Dienstes oder einer virtuellen Bibliothek, kann zusätzlich den Wahrheitsgehalt einer Online-

Quelle stützen. Der letzte Punkt der Bewertung umfasst schließlich die Benutzerfreundlichkeit der Website. Dieser Punkt beinhaltet nur rein webspezifische Elemente. Dabei handelt es

sich um die Struktur und Navigation innerhalb einer Seite, den Zugang zu der Quelle und die Ausnutzung der interaktiven und multimedialen Möglichkeiten.
Am Ende der Evaluation steht die Gesamtbeurteilung der Online-Quelle. Hierzu muss aber noch ein Vergleich mit anderen Webseiten erfolgen, so dass die dargebotene Informationsqualität in Relation gesetzt werden kann.

Solange im Internet keine Standards der Informationsaufbereitung und Qualitätssicherung herrschen, und dies wird aufgrund der dezentralen nicht-hierarchischen Struktur wohl sobald nicht geschehen, ist der User auf solche Evaluationskriterienkataloge angewiesen, wie ich sie in dieser Arbeit diskutiert habe.

6. Literatur

Die Internet-Quellenangabe werden bei einem Zeilenumbruch mit einem Bindestrich getrennt. Um Verwechslungen mit Adressbestandteilen zu vermeiden, erfolgt die Trennung immer direkt nach einem Schrägstrich „/“.

- **UpsideToday: Vote-auction.com rises again**

That scrappy voter auction website that has riled America's pollsters skirted yet another siege by U.S. legal critics Wednesday re-emerging under a new domain after the site's latest address, Vote-auction.com, once again was shut down by authorities.
<http://www.upside.com/News/3a0193301.html>

- **USA Today: Votes up for auction draw official inquiries**

Pranks or not, legal officials and election watchdogs are taking seriously the recent attempts to buy and sell political votes on the Internet.
<http://www.usatoday.com/life/cyber/tech/jk082300.htm>

- **Vote-auction.net**

Bringing democracy and capitalism closer together. Founded by James Baumgartner (as voteauction.com), produced by ubermorgen.com and helped by @TMark.
<http://vote-auction.net/>

- **Wired: Selling Votes or Peddling Lies?**

Did Voteauction.com really solicit bids on American votes, or was it all a mirage? The owner says yes, while the site's creator says no. A judge will decide.
<http://www.wired.com/news/politics/0,1283,39770,00.html>

- **Wired: Austrian Takes Bids on U.S. Votes**

Voteauction.com has changed owners as well as modus operandi. And this time, it appears, the prospect of squelching the wrongdoing is going to involve more than a threatening phone call.
<http://www.wired.com/news/politics/0,1283,38559,00.html>

- **Wired: Chicago to Sue Vote Auctioneers**

Election officials in Chicago are expected to file suit after finding more than 1,000 Illinois residents have signed up to auction off their presidential votes.
<http://www.wired.com/news/politics/0,1283,39431,00.html>

- **Wired: Close Vote? You Can Bid on It**

If citizens do indeed find the choice between Gush and Bore meaningless, the proprietors of Voteauction.com say, why not at

least make a little cash on the side?

<http://www.wired.com/news/politics/0,1283,38229,00.html>

- **Wired: Thousands Sign Up to Sell Votes**

Boasting of the more than 6,000 Americans who have signed up to auction off their presidential votes to the highest bidder -- illegal activity under the laws of every state in the union -- Voteauction is now detailing its plans to begin an outreach campaign.

<http://www.wired.com/news/politics/0,1283,38931,00.html>

- **Wired: Voteauction Bids the Dust**

Last week, Voteauction received a spate of publicity that began with a Wired News story. Two days of intense press and Internet attention followed, which concluded in legal threats that compelled its operator to shut it down.

<http://www.wired.com/news/politics/0,1283,38355,00.html>

- **Wired: Voteauction Booth is Closed**

The vote buy-and-sell website shuts down after a district court in Illinois slaps it with an injunction. Accused of illegally trafficking votes, its creator now says the whole thing was a joke.

News : Août 2000

Abréviations utilisées : NPLN -> Note Pour Les Novices, CONTQM -> Cette Opinion Ne Tient Qu'à Moi

Jeudi 31 Août 2000

- **Ca n'a rien de surprenant...**

Le logiciel Promis, qui avait beaucoup fait parler de lui dans les années 80 est un logiciel destiné aux juristes qui classe les documents et d'établir des corrélations entre eux. Il a depuis été retouché par l'administration américaine qui l'a revendu, sous un autre nom, à l'étranger, à des services secrets (en Jordanie et Israël, notamment) mais aussi à des sociétés, dont quelques grandes banques françaises.

Cependant, les modifications auraient consisté en la pose de dispositifs d'écoute et d'intrusion sur les ordinateurs où il serait installé, donnant ainsi aux États-Unis la possibilité d'espionner un grand nombre d'entreprises et d'agences gouvernementales. Juste là, tout va bien pour les américains sauf que le gouvernement canadien qui utilise le logiciel PIRS pour coordonner les enquêtes des ses services secrets et de la Police montée, soupçonne que ce soit une de ces version de Promis. Une enquête a donc été ouverte pour déterminer si des mouchards existent bien.

- **France Telecom ne possède pas les Pages Jaunes.**

France Telecom, qui possède www.pagesjaunes.fr, avait demandé à l'Office Mondial de la Propriété Industrielle (OMPI) de statuer en sa faveur sur la question de savoir à qui appartiennent les domaines pagesjaunes.com, pagesjaunes.net et lespagesjaunes.com. Mais l'OMPI n'a pas suivi en expliquant notamment que autres annuaires nommés Pages Jaunes existent dans des pays francophones avec le nom pagesjaunes.ch, pagesjaunes.ca, pagesjaunes.be, pagesjaunes.lu.

- **Tout le monde a droit à un e-mail... 2ème édition**

La Poste a annoncé qu'elle allait offrir un e-mail gratuit à chaque français, qui est consultable directement de chez vous (sur le site ou sur votre gestionnaire de mails) ou sur des bornes payantes dans les postes. Seulement voilà, le service existe depuis un an....

- **Sony sort son Palm**

Sony et Palm ont dévoilé le Clie, premier PDA issu de leur alliance qui marque l'entrée du Japonais sur ce marché grandissant.

- **Les rumeurs se précisent**

La société Mainsoft, développeur Unix/Linux, est soupçonnée d'être l'un des piliers de la conversion d'Office sous Linux. Elle a déjà porté I.E. et Windows Media Player sur cette plate-forme. (CONTQM : Si on trouve même les logiciels MS sous Linux, quel sera l'intérêt de conserver Windows ?)

- **AGP x8 pour Intel**

Milieu 2001, Intel devrait sortir ce nouveau bus graphique qui permettra d'accélérer encore la 3D.

- **Nouveau système de promotion**

Au Etats-Unis (ailleurs je ne sais pas), Windows Me (NPLN : Windows Millenium, qui sort le 14/09 partout dans le monde) sera distribué sous forme de démos dans les grands magasins.

Mercredi 30 Août 2000

- **Les nouveau amis de Napster**

De nombreuses organisations se sont constituées soutiens de Napster devant la Cour d'appel, comme par exemple la Consumer Electronics Association (CEA) et la Digital Media Association (DiMA).

La CEA estime que le juge a mal interprété le cas du Betamax de Sony de 1984 car Napster a, à ses yeux, créé un nouveau standard qui peut avoir des applications légales bien qu'il soit souvent utilisé pour enfreindre la loi. La DiMA qui représente plus de 960 ntreprises dont AOL et Yahoo rejoint les positions de la CEA.

- **Barbie fait confiance aux petites filles**

Les directeurs de Barbie.com a engagé 26 petites filles entre 6 et 12 ans pour les aider à repenser le site qui avait été ouvert cet été. Toutes les semaines ces filles recevaient par mail des photos d'écran du site en construction et étaient questionnées par e-mail ou téléphone. Bien sûr elles ont reçu une rémunération (non communiquée) pour leurs services.

Il semble que cette façon de procéder soit payante puisque le trafic a doublé à la réouverture du site puis a quadruplé après les publicités à la T.V.. De plus, les visiteurs se fidélisent. Le visiteur reste à chaque fois 26 mn en moyenne.

- **Freesurf sanctionne des abonnés**

Suivant la route tracée par OneTel, Freesurf a inscrit sur une liste noire et déconnecté des abonnés du forfait illimité soir et week-end pour avoir brisé les règles. Selon les conditions du forfait à 100 F/mois, l'abonné est restreint à la consultation du web et de ses mails et aux groupes de discussions. Mais 531 abonnés ont été déconnectés en une semaine, sans préavis et en n'ayant pas

forcément enfreint les règles. Ils sont accusés d'avoir utilisé des passerelles pour télécharger des logiciels.

Sur le fait qu'il y ait eu des erreurs et pas de préavis, le directeur de Freesurf explique "qu'il s'agissait d'une mesure d'urgence. Mais nous nous sommes rendus compte que certaines pratiques étaient considérées à tort comme des fraudes." Ils sont donc en train d'examiner les cas un par un pour reconnecter ceux qui ont été déconnectés par erreur. Parmi les erreurs techniques relevées, un abonné qui introduirait tout simplement un CD dans son PC et lancerait le logiciel de lecture WinAmp tout en étant connecté serait considéré comme un fraudeur car WinAmp utilise un protocole interdit par le forfait illimité. Freesurf soutient cependant vouloir poursuivre son offre d'accès illimité.

- **Les antennes-relais seraient dangereuses**

Selon une étude commandée par la revue Science et Avenir, les vibrations qui transmettent les signaux radio de téléphonie mobile seraient nettement plus nocives que les opérateurs ne le déclarent.

L'étude, réalisée dans quinze appartements d'Ile-de-France situés derrière une antenne-relais ou au dernier étage d'un immeuble en accueillant une, révèle que dans près de deux cas sur trois, l'intensité des radiations émises est dix fois supérieure aux valeurs annoncées par les laboratoires de France Telecom.

Déjà, en avril 1999 déjà, la direction générale de la santé et le secrétariat d'Etat au logement avaient publié un rapport préconisant une « restriction d'usage totale ou partielle » des balcons de HLM sur lesquels sont installées ces antennes, voire même une « condamnation de certaines pièces d'habitation ».

- **Intel largué**

Le PIII 1,13 GHz a été retiré de la vente 1 mois après sa sortie à cause d'une anomalie sur un circuit entraînant des problèmes de fonctionnement avec certains logiciels. De plus certains assembleurs comme Dell avaient déjà suspendu leurs commandes en raison de l'incapacité d'Intel à fournir ce modèle en nombre suffisant. Pendant ce temps, AMD a lancé son Athlon 1,1 GHz et il a déjà plus de 10 constructeurs comme clients, notamment Compaq, Fujitsu Siemens Computers, Gateway, Hewlett-Packard et IBM.

AMD est donc seul sur le créneau haut de gamme et son produit est moins cher. Intel prévoit que les modifications à apporter au design de son PIII vont prendre quelques mois..... autant dire une éternité vu que les processeurs cadencés à 1,5 GHz sont attendus d'ici peu.

- **Amazon.com crée Amazon.fr**

L'ouverture a eu lieu dans la nuit du 30 au 31 août. Le site proposera 4 boutiques (livres, musique, DVD et vidéo) qui proposeraient l'ensemble des références disponibles en France. Cependant, contrairement à ses concurrents, aucun chiffre n'a été donné pour les produits français alors que l'on connaît ceux des produits étrangers (240.000 références de CD en import, 700.000 livres en anglais). Pour les prix, le site se conformera à la réglementation française en vigueur sur le prix unique du livre.

N'ayant pu racheter Alapage (France Telecom a été plus rapide), Amazon a du

construire un site de toute pièce mais a su s'entourer d'une équipe composé d'anciens de chez Vivendi, Havas ou la FNAC. Mais les concurrents, la FNAC, Alapage et BOL ne s'inquiètent pas et pensent même que la campagne de publicité que va lancer Amazon va leur être bénéfique.

- **Entre Netscape et I.E., choisissez K-Meleon**

Il s'agit d'un navigateur gratuit et sous licence G.P.L. (NPLN : le code source du logiciel est disponible et modifiable à volonté par tout un chacun) qui ressemble à I.E. mais qui intègre le moteur d'interprétation Gecko, qui sera au coeur de Netscape 6. On a donc là un clone plus léger (4 Mo) de Netscape Navigator, il intéressera donc : tous ceux qui veulent disposer des navigateurs de Microsoft et de Netscape, les développeurs de sites web souhaitant s'assurer de l'apparence d'un site dans les deux versions ou les internautes voulant se rendre sur des sites inaccessibles avec I.E..

Pour les familiers du monde Unix/Linux, c'est le pendant Windows de Galeon (qui intègre déjà Gecko).

- **La dernière version de MS Office est en test**

Office 10 inclura une nouvelle technologie de reconnaissance vocale, un support XML additionnel, une application de collaboration par Internet et des outils de gestion du contenu.

- **Du nouveau sur les Palms**

Un programmeur a créé le premier Cheval de Troie connu pour Palm...

Mardi 29 Août 2000

- **Virus pour les enfants**

Ça vient de sortir ! Si vous recevez un e-mail avec Pikachu (le Pokemon !) en fichier attaché, ne cliquez pas dessus. C'est un nouveau virus qui traîne sur le net.

- **Motorola jette l'éponge sur Iridium**

Ça faisait quelques temps que ça couvait... Faute de repeneur, Motorola a décidé de saborder les 66 satellites de son réseau de téléphonie mobile. Voilà comment jeter facilement 7 milliards de \$!

- **Pentium IV a grossi**

Il faut s'attendre à ce qu'Intel ait du mal à fournir le Pentium IV et qu'il soit cher. En effet, le petit nouveau contient 42 millions de transistors (contre 28 pour le PIII), soit une surface de 217 mm² (contre une centaine sur le PIII). Ils seront produits avec les mêmes technologies que le PIII mais du fait de sa taille, Intel ne pourra en monter qu'un par galette de silicium là où il montait deux PIII en même temps. Le calcul est donc très simple : vitesse de production réduite de moitié et coût de matière première doublé... que devient le prix final ?

A moyen terme, le problème de surface devrait être réduit avec le passage à la

technologie 0,13 micron et l'utilisation de galettes de 300 mm contre 200 actuellement.

Un processeur nommé Foster devrait suivre. Il s'agit d'un PIV pour serveurs et stations de travail

- **Riposte d'Intel**

Intel a aussi dévoilé la technologie XScale qui vise à contrôler consommation et dégagement thermique et qui présente de nombreuses similitudes avec le processeur de Transmeta.

- **PGP buggé**

PGP (Pretty Good Privacy), la référence en matière de cryptage souffrirait d'un bug qui, dans certaines conditions permet accéder, dans les versions Windows, aux données décodées.

- **Micro\$oft bouche les trous**

Une faille dans FrontPage Server Extensions rendait possibles les attaques du type Denial of Service. Microsoft aurait corrigé le problème.

- **Rumeurs**

Il semblerait que Micro\$oft fasse développer par une firme israélienne une version de sa suite Office pour Linux. MS a bien sûr démenti la rumeur.

- **Oracle gratuit**

La firme a lancé OracleSalesOnline.com, un service qui offrira, le logiciel de base d'automatisation de la force de vente gratuitement. Seuls les modules additionnels seront payants, comme le logiciel de "sales-compensation", selon un système de pay-per-use (paiement à l'utilisation).

- **TrustE perd en crédibilité**

Le sceau TrustE est en temps normal une marque de garantie de la confidentialité sur des sites marchands. Mais l'organisation aurait fait profiter une société des données de ses visiteurs.

- **Yahoo veut crypter**

Yahoo prévoit de permettre aux utilisateurs de ses services mail de crypter leurs messages en utilisant le site SecureDelivery.com. Il serait le premier à proposer cette option.

- **Microsoft a des problèmes avec Hotmail**

Des utilisateurs Hotmail ont expliqué que suite à la fermeture de leur compte pour cause d'inactivité (ce qui est normal) ils ont créé un nouveau compte avec le même nom d'utilisateur et ont découvert avec étonnement que leur liste de contacts AIM était maintenue sur leur nouveau compte. Conclusion, si quelqu'un crée un compte avec votre ancien pseudo, il récupère votre liste de contact. Micro\$oft enquêterait de manière approfondie sur la question.

- **Nintendo se donne du temps**

Le Gameboy Advance ne sortira qu'en Mars au Japon et en Juillet en Europe à cause de ruptures de stocks en composants qui sont dus en grande partie à la forte demande actuelle en Gameboys Color

- **Du nouveau chez les cellulaires**

Suite à la polémique sur les dangers des cellulaires en matière de radiation, les principaux constructeurs ont décidé d'indiquer sur les emballages la quantité de radiations émises par leurs appareils

Mercredi 23 Août 2000

- **Dure concurrence pour Intel**

AMD (le grand rival) et Transmeta (l'étoile montante) devraient annoncer un coopération technologique. Transmeta est très intéressé par la technologie LDT (Lightning Data Transfer) créée par AMD qui accélère les échanges de données entre le processeur et les différents composants du PC et qui sera intégré aux jeux de composants des Athlon en 2001. Cette technologie permettrait à Transmeta d'atteindre le GHz. De son côté, AMD aurait accès à la technologie de Transmeta, dont les processeurs consomment 50 % d'énergie en moins que ses concurrents à fréquence égale.

Cette alliance ne va pas faire le bonheur d'Intel qui perd des parts de marché et patauge entre ses problèmes avec les composants i820 et les retards sur le Pentium IV, d'autant plus qu'AMD sera bientôt sur tous les fronts : portables (Athlon mobile fin 2000), ordinateurs de bureau (Athlon Thunderbird 1,2 GHz), serveurs (Sledgehammer).

- **Premier cyber hold-up**

Egg, la banque britannique uniquement on-line a été électroniquement "braquée". Selon la banque, aucune perte (quelques dizaines de milliers de £) n'a été subie. Le 3 malfaiteur présumés ont été arrêté après une enquête de 6 mois suite à une alerte de Egg qui dispose de logiciels permettant de repérer tout ordinateur à partir duquel sont effectuées des opérations multiples.

- **Faites vos courses**

Uranium Online est un site qui vous permet d'acheter des barres de combustible nucléaire en ligne...

- Selon une étude de NetValue, 575000 heures auraient été consacrées aux jeux d'argent en ligne au mois de juillet.

- **Radio France est web-actif**

Mi septembre, Radio France va sortir la première de ses Webradios thématiques. Ce sera "la radio du livre".

Mardi 22 Août 2000

- **Le philippin s'en sort bien**

Le gouvernement Philippin, faute de loi adaptée, a décidé abandonner les charges retenues contre l'auteur présumé du virus 'I Love You', ce qui ne fait pas la joie des américains.

- **Gadget inutiles**

Sous prétexte de l'explosion des nouvelles technologies ont veut nous faire acheter n'importe quoi...

Philips, en collaboration avec Levi's va sortir en France en Septembre des blousons avec écouteurs intégrés et prises pour connecter téléphones mobiles et lecteur MP3.

- **Le Xeon suit le mouvement**

Le Xeon, processeur haute performance d'Intel va lui aussi être très bientôt porté à 1 GHz

- **On ne s'arrête plus d'accélérer**

Cette semaine, Intel a dévoilé cette semaine sont pentium IV. Les analystes estiment qu'il devrait atteindre les 10 GHz d'ici 4 ans.

Le fondeur a aussi annoncé la sortie de nouveaux processeurs pour serveurs et pour ordinateurs de poche.

- **Un de moins**

MP3.com avait 4 procès pour violation de copyrights sur le dos, il n'y en a plus que 3. Le site vient de conclure un accord avec Sony qui lui permettra de distribuer la musique du producteur.

- **Reality Run : fin de la course**

La semaine dernière je vous parlais de la chasse à l'homme organisée en Allemagne, Roger, le fugitif, a été rattrapé au bout de 7 jours par la chasseuse de prime qui empoche 10000 \$ au passage. Si vous êtes intéressés vous pouvez faire acte de candidature. Les prochains sites, pour lesquels votent les internautes, pourraient être Vienne ou Amsterdam.

Lundi 21 Août 2000

- **Altavista U.K. renonce**

C'est tombé lundi, le patron d'Altavista U.K. a annoncé que le forfait illimité ne se ferait pas (au passage je corrige ce que j'ai dit la semaine dernière, le forfait était de 60 £ / an). Il a prétexté que c'était de la faute de British Telecom qui ne lui avait pas proposé de forfait comme prévu mais des tarifications à la minute. Et British Telecom de dire que ce n'est pas de sa faute, blah, blah, blah.... Bref fin d'une aventure qui n'avait pas commencé.

- **Forfait illimité de OneTel**

L'Association des Internaute Médiateurs (ADIM) a demandé l'assignation en référé de OneTel pour tout le flou et les nombreux revirements ayant entouré le forfait illimité de l'opérateur (hésitations de la hotline, accusations de fraude, les connexions impossibles,...)

- **Les prochains processeurs d'Intel**

On en sait un peu plus sur la prochaine série d'Intel : Les vitesses débiteront à 1,4 GHz et ils seront basés sur une nouvelle architecture pour accélérer la vitesse de streaming et faciliter le travail peer-to-peer (égal à égal) en réseau.

- **AMD marque un point**

C'est n'est pas sur le plan de la vitesse des processeurs ou AMD est toujours à 1,1 GHz et Intel à 1,13 mais sur celui des prix. AMD a décidé de casser les prix des Athlon et Duron a titre d'exemple aux ÉtatsUnis :

Intel Pentium III 850 MHz (256K L2 Cache, 100 MHz FSB, Slot 1): 454 \$

AMD Athlon 850 MHz (512K L2 Cache, 200 MHz FSB, Slot A) : 239 \$

A ce prix là, y'a pas photo pour le choix... Mais pour les inconditionnels d'Intel, pas de panique, on peut raisonnablement penser qu'il suivra.

- **Nokia fonctionnera en Open-Source**

Nokia a sorti son nouveau navigateur internet pour téléphone cellulaire. La firme a décidé de laisser le code en Open-Source en espérant ainsi marquer des points le marché des logiciels "sans fils".

- **Compaq remporte un gros contrat ?**

Compaq devrait normalement emporter un contrat avec le Ministère de l'énergie américain pour un super-ordinateur de simulation des armes nucléaires.

Dimanche 20 Août 2000

- **Premier agrément pour mobile monétique**

C'est Sagem qui a été le premier à obtenir, pour un terminal GSM monétique, l'agrément EMV délivré par Europay International. C'est un téléphone de la gamme Sagem 900 qui vient de recevoir cet agrément. Il pourra donc être utilisé pour payer avec sa carte bancaire (Mastercard ou Visa) à distance, y compris pour des paiements internationaux, en toute sécurité. Ce téléphone est associé à une batterie monétique disposant du coupleur carte à puce, associé à une application située dans la carte SIM de l'opérateur. Sagem a déjà enregistré plus de 500000 commandes.

- **Protégez-vous des ondes mobiles**

Alors que la polémique fait rage pour savoir si oui ou non et dans quelle mesure les téléphones mobiles sont dangereux pour la santé, la société japonais Gunze vient de mettre au point un T-shirt, le "Pace protector", qui protège des ondes

électromagnétiques en en supprimant jusqu'à 92%. En fait, il a été conçu pour les porteurs de stimulateur cardiaque. Il est tissé en fil de nylon argenté et est efficace même à 2 cm du pacemaker. Son prix, 1640 F.

- **Les grosses dépenses de France Telecom**

C'est maintenant les dans les licences UMTS belges et suédoises que FT a décidé d'investir.

Pour la Suède c'est par le biais de sa filiale Orange et en collaboration avec Skanska (groupe du bâtiment) et la Swedish Broadband Company.

En Belgique, c'est la filiale Mobistar qui va au charbon. L'acquisition, si elle se fait, sera payée par l'endettement et une augmentation du capital. De plus FT envisage que la filiale de Mobistar, Mobistar Corporate Solutions fusionne avec Global One, le groupe de services de communication pour grandes entreprises acquis en début d'année..... par France Telecom.

- **Saut quantique pour les ordinateurs**

(Attention, je vais parler un peu technique, pour ceux qui n'auront pas tous compris -essayez quand même-, dites vous que c'est plus d'une dizaine d'années de théories et d'expériences qui commence à montrer des signes de "réalisabilité")

Bienvenue dans le monde du spin nucléaire et des enchevêtrements subatomiques. Les chercheurs d'IBM ont montré que l'ordinateur quantique, dont on parle depuis de nombreuses années, est réalisable et devrait largement distancer les meilleurs super-ordinateurs. Ils ont annoncé qu'il avaient utilisé "l'ordinateur quantique le plus moderne au monde" pour résoudre en une étape un problème mathématique alors qu'il en faudrait 4 avec un ordinateur conventionnel. On espère pouvoir ainsi surpasser l'architecture silicium en utilisant notamment le fait qu'une particule subatomique peut exister dans deux états quantiques apparemment opposés. Bien sûr, l'ordinateur d'IBM, ne tient pas dans la poche. Il occupe une demi pièce pleine d'électro-aimants et de spectromètres.

Le coeur du système est constitué de 5 atome de fluor, chacun représentant un unique "bit quantique" ou "qubit" de capacité de stockage en suspension dans une molécule spécialement conçue pour. Lorsqu'on lui applique un champ magnétique, le noyau au centre des atomes peut être mis en rotation rapide de façon mesurable et contrôlable, en utilisant l'Imagerie de Résonance Magnétique (IRM, comme en médecine). Chaque noyau en rotation interagit avec les autres, créant un "enchevêtrement" qui défie logiquement les lois quantiques et que les chercheurs peuvent dompter pour effectuer des calculs à une vitesse phénoménale. Isaac Chuang, leader du projet ordinateur quantique chez IBM souligne que "c'est la première fois qu'une équipe réussit un calcul en utilisant une molécule de 5 qubit". Cependant il ne faut pas s'attendre à voir les premières applications commerciales d'ordinateurs quantiques avant au moins 20 ans.

Chez H.P., on salue les avancées d'IBM qui sont considérées comme "impressionnantes et encourageantes". Mais la firme, elle, travaille sur un type

plus conventionnel d'ordinateur super-rapide et à faible consommation pour lequel ils s'attendent à pouvoir produire des résultats d'ici 5 ans. D'autres voies explorées sont celles de l'ordinateur biologique construit à partir d'ADN ou d'ordinateurs pour lesquels on utiliserait des réactions chimiques pour assembler des composants encore plus petits.

- **Linuxiens, choisissez votre camp**

De grandes compagnies se sont associées dans la Gnome Foundation pour soutenir Gnome l'une des deux interfaces graphiques les plus utilisées sous Linux. Ce groupe dirigera le projet et décidera quels packages doivent être inclus dans Gnome. Les sociétés impliquées sont, entre autres, Sun Microsystems, VA Linux Systems, Collab.Net, Compaq Computer and IBM plus celles qui sont directement impliquées dans le projet : Red Hat, Gunitais, Henzai, Eazel et Hélix Code. Ajoutez à cela des participation de la Free Software Foundation (pionnière dans le logiciel open-source) et l'Object Management Group (qui s'attache à créer des programme qui communiquent ensemble de façon standard).

Ceci ne va pas aller dans le sens de l'unification avec le compétiteur principal, KDE, qui est utilisé dans les distributions de SuSE, Corel, Caldera, Red Hat, sur les ordinateurs Linux d'IBM. Cette séparation entre les deux grands est dangereuse parce que les programmeurs auront à choisir entre les deux pour assurer la compatibilité de leurs logiciels.

Sun Microsystems va adopter l'interface Gnome pour ses système d'exploitation Solaris et fournira plus de 50 programmeurs au projet Gnome. De plus, StarOffice (le pendant de Micro\$oft Office sous Linux), appartient à Sun est sera donc plus étroitement lié à Gnome. La suite adoptera Bonobo, une technologie Gnome similaire au logiciel Microsoft COM qui permet à un programme d'utiliser les composants d'un autre (par exemple, un gestionnaire de mail peut utiliser le moteur Gecko de Netscape ou un Messenger Instantané utiliser le correcteur d'orthographe de StarOffice).

- **La démocratie en danger**

Les américains nous auront tout fait ! La commission électorale fédérale américaine a découvert que des votes avaient été mis aux enchères sur eBay. Et les enchères (sérieuses ou non) variaient de 5 à 10000 \$. Averti, eBay a supprimé les offres.

D'autres, comme le site Vote Auction vont plus loin, tentant d'ériger l'idée en système. Derrière le site, James Baumgartner, un étudiant qui a fait de Voteauction son sujet de thèse. « De toute façon, explique-t-il, c'est le candidat le mieux pourvu financièrement qui gagne quasiment à tous les coups. » S'il ne s'adresse pas directement aux candidats, le site ouvre ses enchères aux entreprises qui financent d'ordinaire les campagnes. L'analyse rejoint celle d'un internaute qui tente de vendre son vote aux enchères sur Yahoo. « Les sénateurs vendent régulièrement leur vote au plus offrant, avance-t-il, Pourquoi le citoyen américain serait-il exclu du système ? »

Samedi 19 Août 2000

- **Marijuana Express**

iToke, un site hollandais compte lancer à Amsterdam un service de livraison de marijuana à domicile.

- **Netscape Communicator 4.75**

Je sais, il y a eu la version 4.74 le mois dernier, mais si cette nouvelle mise-à-jour sort si vite après c'est qu'elle contient le correctif permettant de réparer le trou de sécurité, dont je vous parlais la semaine dernière, Brown Orifice.

- **AMD n'oublie pas Linux**

AMD recrute actuellement des développeurs Linux pour écrire des logiciels pour le Sledgehammer, son processeur 64 bits qui devrait sortir courant 2001. La firme a créé un site web pour les développeurs Linux et enverra aux participant un "simulateur de technologie" du processeur pour que les entreprises puissent commencer à faire migrer leurs systèmes d'exploitation et logiciels. Et il parait que ce n'est qu'un début...

- **IBM fait la promotion de SuSE**

Big Blue fournira une version CD de la distribution Linux de Suse avec chacun des serveurs Intel qu'il vend en Europe. SuSE estime que cette collaboration devrait lui permettre de faire essayer sa technologie à 20000 clients potentiels.

- **AOL sur Linux ?**

Un site web (<http://www.techpages.com>) propose une pré-version non-officielle d'AOL pour Linux. son nom de code : Gamera. Certaines sources proches d'AOL auraient confirmé que le logiciel est authentique...

- **Corel Linux Second edition**

La première version a fait un pas important dans la simplification de l'installation de Linux mais il semble que cette nouvelle version fassent encore mieux.

- **I Love You Again**

Quelques firmes Américaines et Européenne ont été touchées par une nouvelle version du ver "I Love You" (VBS/Loveletter.bd), il s'agit notamment de banques. Cette nouvelle mouture télécharge et lance un programme nommé "hcheck.exe" qui qui récupère les mots de passe stockés sur l'ordinateur infecté.

- **Sony sur de nouveaux créneaux**

Le Walkman a fait son succès, Sony a donc décidé d'ici la fin de l'année, de sortir une nouvelle ligne de walkmans MP3. Mais ce ne sera pas tout, la firme sortira aussi d'autres appareils internet et des téléphones cellulaires.

- **Un PDA change le cours d'un procès**

Aux Etats-Unis, un procès pour meurtre va devoir être recommencé parce qu'un

des jurés a lu des commentaires sur le procès sur son PalmPilot.

- **Transmeta accroche un nouveau gros contrat**

Vaio, c'est la gamme d'ultraportables de Sony. Ils étaient jusqu'à présent équipé d'un Celeron 366. Mais la nouvelle gamme C1 sera, elle, équipée d'un Crusoë de chez Transmeta. C'est la faible consommation électrique et la dissipation thermique réduite qui fait basculer le choix de Sony vers le nouveau venu. En effet, le Crusoë consommerait 1 Watt (0,02 en mode veille) contre 15 à 20 pour les Celeron.

Après le contrat signé avec IBM, il ne manque plus que Toshiba au tableau de chasse de Transmeta pour avoir toutes les grosses pointures du monde de l'ordinateur portable.

- **Hallucinant !**

Pour faire sa promotion, un site internet offre 5000 \$ au 10 premiers bébés qui porteront légalement son nom.

- **Webmasters, attention !**

Un éditeur de site a été condamné par la justice américaine pour un lien qui renvoyait vers le code source du DeCSS, logiciel illégal permettant de pirater les DVD. Ce cas pourrait faire jurisprudence.

- **Tuez à distance**

Columbo va avoir du fil a retordre... L'Institut de technologie thaïlandais King Mongkut a présenté un robot armé qui détecte les intrus grâce à une caméra et des capteurs. Vous passez un ordre par Internet et il tire.

Jeudi 17 Août 2000

- **Chasse à l'homme**

Les allemands ont lancé un nouveau jeu le 14/08 : un chasse à l'homme dans Berlin en direct sur le WebLe fugitif, Roger, enseignant en Hollande. Sur ses traces Jack Black, chasseur de primes qui gagnera 10000 \$ s'il rattrape Roger. Roger porte sur lui une webcam et un micro pour que les internautes puissent tout suivre sur le Net et n'a le droit qu'à 2 h de répit par jour dans une cache secrète. Pour être sûr que le fugitif n'attend pas patiemment la fin dans une chambre d'hôtel, il doit suivre un parcours quotidien qui passe par des lieux connus de Berlin qu'il doit prendre en photo. Ensuite, il doit laisser les photos (en format numérique) sur un banc ou collé à une poubelle pour que les organisateurs les récupèrent.

Les internautes ne doivent pas participer physiquement à la chasse mais peuvent aider Roger ou Jack sur le Net. Soit dit en passant Roger n'est pas discret puisqu'il porte un tee-shirt aux couleurs du site.

Le jeu, qui enregistre 600000 pages vues par jour doit durer 24 jours et recommencer ensuite avec un nouveau candidat. S'il en réchappe, Roger gagnera 100000 \$!

<http://www.realityrun.com> (le site est aussi en anglais)

- **Nouveau problème de sécurité**

Un nouvel utilitaire internet permet de scanner l'IIS (Internet Information Server) de Microsoft, découvrir ses points de vulnérabilité et lancer une attaque qui peut révéler les nom et mots de passe des utilisateurs. Et c'est sur ce système serveur que Microsoft veut faire migrer MSN Messenger !!!!

- **Va-t-il se casser les dents ?**

Malgré les déboires de ses prédécesseurs, un nouveau FAI se lance dans l'internet illimité. AOL vous proposera, dès lundi, ce service 24h/24 pour 99 F par mois. La contrepartie, vous vous engagez pour 24 mois. (CONTQM : ceux qui il y a un an se sont engagé avec un abonnement d'un an chez AOL pour avoir des prix plus bas se sont mordus les doigts avec l'arrivée des FAI gratuits, est-ce le moment de recommencer ? 2 ans, en matière d'informatique, c'est très long. Tout peut arriver...)

- **L'escroc Altavista**

Le portail a annoncé un forfait illimité en Grande-Bretagne pour 60 £/mois. Il a ensuite affirmé que les inscription se ferait par lots de 25000 par semaine pour ne pas engorger le service. Le Mirror a donc mené l'enquête pour trouver des internautes qui profitent de ce service (ils devraient être 100000 à l'heure actuelle) et pas moyen d'en trouver un seul. Et bizarrement, seul le PDG d'Altavista U.K. peut s'exprimer sur la question, lequel passe des vacances qui n'en finissent plus de s'allonger. Pourquoi un portail de cette envergure aurait-il tenté une telle escroquerie ? Nous en saurons plus après les vacances du PDG...

- **Contenus payants**

Realnetworks, la firme propriétaire du célèbre RealPlayer a annoncé le lancement aux États-Unis d'un forfait payant qui permettra d'accéder à des programmes exclusifs chaque mois.

Mercredi 16 août 2000

- **Stinger le nouvel OS de Micro\$oft**

Non, ce n'est pas le successeur de Windows ME c'est tout simplement l'OS que Micro\$oft a conçu pour les téléphones cellulaires. Il s'agit d'une version réduite de Windows CE. Il propose, en plus des fonctions de téléphonies, un agenda intelligent qui peut forcer le téléphone à vibrer plutôt qu'à sonner aux heures de réunion et fonctionner en relation avec Outlook, et peut gérer l'affichage couleur. Samsung, s'est déjà montré intéressé par le système. Micro\$oft travaille par ailleurs sur un OS supplémentaire destiné, celui-là, à équiper les téléphones permettant d'accéder à Internet.

Tout cela ne sera pas de trop pour faire face à la montée en puissance programmée de Java et Linux sur toutes ces petites machines

- **Zapstation**

On pensait avoir tout vu ? Voici la Zapstation. C'est une sorte de console qui se branche sur votre T.V.. Elle offre un accès Web, lit les fichiers MP3, les CD et les DVD, télécharge des vidéos, reçoit les radios mondiales... Elle embarque une disque dur de 30 Go, utilise un Celeron 566 Mhz et peut-être reliée à une imprimante, un baladeur, tout type de périphérique informatique classique, à un ampli. Vous l'utilisez grâce à une télécommande et un clavier sans fil. Elle sera disponible vers Novembre.

<http://www.zapmedia.com>

- **SVG version finale**

SVG signifie Scalable Vector Graphics et s'appuie sur le langage XML. Ceci garantit donc une indépendance vis-à-vis des plates-formes. Il est indépendant de la résolution de l'écran et peut intégrer des textes descriptifs. De plus il permet de créer des liens vers des zones de l'images sans avoir à la mapper. Le gros problème est qu'aucun navigateur ne supporte évidemment ce format pour l'instant. Seul Adobe propose de télécharger un plug-in.

- **m100, le nouveau Palm**

Il devait être moins cher, c'est le cas aux États-Unis (150\$) mais en France il sera à 1500 F (comme le Palm III). Le nouveautés ? Son capot devient amovible (les nouveaux, disponibles en 4 couleurs, coûtent tout de même 200 F pièce !) et il possède un petit hublot qui permet de voir l'heure même capot fermé. Il est plus petit que la série III, faisant perdre à l'écran 1/4 de sa surface et une nouvelle touche permet d'accéder directement au bloc-note. La synchronisation avec l'ordinateur se fait maintenant directement par câble plutôt qu'avec une station d'accueil. Il fonctionne sous Palm OS 3.5 et emporte 2 petits Mo de mémoire.

- **Nouvelle folie japonaise**

Après le Tamagoshi dans la poche voici les nouveaux venus. Ce sont de petites créatures virtuelles qui s'occupent de vous livrer vos mails. Vous devez donc vous en occuper comme leurs prédécesseurs mais la lecture de votre courrier dépendra leur bonne volonté. Il paraît que les japonais en sont fous.

[La version Sony de la chose](#)

-

Un rapport de Forrester Research conclue que les standards open-source (NPLN : logiciel dont le code est accessible à tout un chacun, comme c'est le cas de Linux par exemple) domineront l'industrie du logiciel d'ici 4 ans. Il ajoute aussi qu'IBM et Dell devraient tirer leur épingle du jeu tandis que Oracle et Microsoft auront à batailler ferme pour s'en sortir.

-

Ce sont les enfants de moins de 11 ans qui cliquent le plus sur les bannières de pubs et les adolescents qui cliquent le moins (soit dit en passant, et moi jamais).

- **Vite !**

Le ministère de la Justice américain veut "expédier" le passage de l'appel de Micro\$oft devant la Cour Suprême parce que ce procès "a une importance extrême pour [leur] économie nationale" (sic).

- **La Banque de France soutient Napster....**

... malgré elle. En effet, un pirate a squatté la page d'accueil d'une trentaine de sites dont celui de la BNF

Mardi 15 Août 2000

- **Bonne blague**

Les clients Londoniens de Safeway, une chaîne britannique de supermarchés ont eut une jolie surprise. Ceux-ci ont reçu un message leur annonçant une hausse des prix et leur conseillant de faire leurs courses ailleurs. La firme n'a toujours pas pu déterminer où était la faille.

Lundi 14 Août 2000

- **Musique mobile protégée**

Intel et Matsushita ont lancé conjointement un système de protection des contenus numériques pour protéger par exemple la musique. Il n'est sûrement pas compatible avec Napster

- **e-commerce Visa ou rien**

Les vendeurs on-line vont devoir les respecter les règles établies par Visa concernant l'e-commerce ou aller voir ailleurs...

- **Un de plus chez Linux**

C'est au tour de Linux, après Dell et IBM de faire de Linux un de ses 3 systèmes d'exploitation stratégiques.

- **e-book par Micro\$oft**

Barnes and Nobles, une chaîne de librairies américaines (deuxième librairie en ligne, loin derrière Amazon.com) et MS lancent le plus gros service de vente de livres électroniques.

Micro\$oft en profite pour glisser Reader 1.5, son logiciel gratuit qui optimise l'affichage des e-Books sur un écran d'ordinateur de bureau ou un PDA, offre des options de recherche de mots, de surlignage ou encore de marque-page. 2000 eBook sont déjà disponibles dans ce format sur le site de Barnes and Noble et 150 titres supplémentaires devraient s'ajouter chaque mois. De plus MS propose d'autres applications dont un programme interagissant dans Word qui permet de convertir un document au format livre électronique et une autre

firme, Overdrive propose un logiciel permettant de faire la même chose à partir d'un document HTML ou d'un fichier texte.

A suivre, les plaintes des éditeurs en réponse à la création de moteurs d'échange d'e-books qui ne sauraient tarder à apparaître.

- **PSX 2 fin novembre**

La Playstation 2 ne sera disponible en France que le 24 novembre pour un prix d'environ 3000 F

- **Un standard de messagerie instantanées**

L'Internet Engineering Task Force va examiner 3 propositions de technologies pour définir un standard de messagerie instantanée. La proposition d'AOL, jugée peu innovante a déjà été rejetée (CONTQM : c'est bien mais pourvu que la technologie retenue n'appartienne pas à Microsoft non plus mais plutôt à une firme encore indépendante)

- **Apache 2.0 arrive**

D'ici la fin de l'année, la version 2 d'Apache, l'application serveur web la plus utilisée dans le monde, devrait être terminée pour la fin de l'année.

- **Hotmail sous Win2000**

Microsoft a décidé de ne plus faire appel au monde du logiciel libre, soit ; mais Hotmail, son service de messagerie instantanée fonctionne sous Apache et FreeBSD ! MS va donc être obligé de le faire migrer sous Windows 2000. (CONTQM : quelque chose me dit que le service sera moins performant !)

- **Le web parlera**

Le W3C (World Wide Web Consortium) travaille sur le SSML (Speech Synthesis Markup Language), une extension du XML (eXtended Markup Language) qui devrait permettre d'intégrer des instructions de synthèse vocale aux contenus textuels du Web permettant de faire des sites interrogeables par téléphone.

- **La chine sous Linux**

L'administration chinoise tournera sous Linux. elle affirme vouloir ainsi "briser le monopole de Windows et des technologies étrangères".

- **Windows is back**

La marine américaine avait renoncé à conserver Windows NT sur ses navires parce qu'il avait tendance à planter. Mais cela ne l'empêche pas d'avoir décidé d'installer une version spécifique de Windows 2000 sur ses nouveaux porte-avions.

- **Carnivore suite**

Le ministère de la Justice américain emploiera une université pour conduire une analyse indépendante du système d'espionnage des mails du FBI : Carnivore.

- **Le 64 bits d'AMD**

Le manuel technique du Sledgehammer, le processeur 64 bits d'AMD a été publié cette semaine. Ce processeur devrait être à la fois capable de gérer les programmes prévus pour les processeurs 32 bits (comme le PIII ou l'Athlon) et les programmes pour les processeurs 64 bits (comme l'UltraSparc de Sun, l'Alpha de Compaq ou le futur Itanium d'Intel).

Vendredi 11 Août 2000

- **Record du monde ?**

La femme la plus "téléchargée" du monde serait Danni Ashe. C'est du moins ce qu'essaye d'établir en ce moment le Livre Guinness des Records. Elle revendique 800 millions de téléchargements. Si vous voulez voir de qui il s'agit : <http://www.dannisharddrive.com/> (pour ceux qui ne s'en seraient pas doutés, il est recommandé d'être âgé de plus de 18 ans !)

- **Un soutien pour Napster...**

...et pas des moindres. Celui qui se faisait dernièrement appeler Prince dit sur son site que Napster est "un développement passionnant dans l'histoire de la musique" et en profite pour critiquer violemment le patron de Time Warner.

- **Poussez-les d'un côté, ils reviennent de l'autre.**

AOL cherche à faire figure propre concernant les MP3 en déconnectant un site de recherche de MP3. Cependant, la firme doit encaisser la sortie d'un nouveau logiciel d'échange de fichiers qui permet aux utilisateurs d'AOL messenger d'accéder à un réseau type Napster.

Pour ceux que ça intéresse, il se nomme AIMSTER et vous pouvez le trouver à : <http://www.aimster.com/>

Jeudi 10 Août 2000

- **Please stop...**

Le Pentagone a lancé un appel aux hackers, les suppliant d'arrêter de s'en prendre à ses réseaux... pour des raisons de sécurité.

- **Un Net-piège...**

Chapeau pour les douanes américaines ! 400 internautes qui espéraient pouvoir accéder à une chaîne satellite américaine à des prix défiant toute concurrence sont en fait tombés dans un piège tendu par les douanes.

- **Le trou de Netscape**

Le trou de sécurité des versions de Netscape antérieures à la version 6 a été dénommé BrownOrifice (petite allusion à son cousin dévastateur BackOrifice). Vous pouvez tester son mode de fonctionnement sur ce site qui lui est dédié : <http://www.brumleve.com/BrownOrifice/>. Ne vous inquiétez pas, je vous

rappelle que c'est sans risque pour votre système si ce n'est qu'on peut parcourir votre disque, sans pour autant pouvoir modifier quoi que ce soit.

La meilleure façon de se prémunir contre cette défaillance du système : désactiver les applet Java, en attendant le patch sur lequel travaille Netscape.

Mercredi 9 Août 2000

- **Après les MP3 et les fichiers multimédia, les jeux**

Swapoo, www.swapoo.com, est un site qui suit le chemin tracé par Napster mais il concerne les échanges de jeux pour consoles.

- **La chasse aux pirates est ouverte**

C'est la nouvelle occupation de Micro\$oft. La firme fait appel à la délation par le biais d'une hot-line et d'un service e-mail mais elle s'est aussi équipée d'outils de recherche automatique pour localiser sur le web les logiciels piratés ou vendus à prix suspect sur les sites web, ftp et de chat.

Un moteur de recherche scrute 24h sur 24 le web a cet effet. Micro\$oft compte ainsi recueillir des milliers d'adresses par jour. Afin de contacter immédiatement les sites ou FAI hébergeurs.

MS est soutenu par la Business Software Alliance, association d'éditeurs dont Microsoft est le principal promoteur.

Parallèlement, MS a aussi nommé un responsable aux affaires gouvernementales pour pousser l'administration américaine à mettre la pression sur les États pirates (la Russie et la Chine notamment).

Les éditeurs américains estiment perdre 150 milliards de francs par an du fait du piratage.

- **Netscape fait fort !**

Les navigateurs Netscape permettraient de voir le contenu de votre disque dur et ceci grâce à un applet Java présent sur certains sites.

Mardi 8 Août 2000

- **Un pingouin au poignet**

Les chercheurs d'IBM ont installé le Système d'exploitation Linux dans une montre-bracelet pour démontrer que le système pouvait être utilisé même dans les plus petits appareils.

- **Transmeta première version**

Transmeta a lancé la production de ses processeurs Crusoe chez Taiwan Semiconductor Manufacturing et d'autres fondeurs ce qui pourrait être le début d'une longue série...

- **Onetel raccroche**

Après la suspension des accès illimités, Onetel a décidé de limiter la consommation des abonnés qui y ont souscrit. (CONTQM : Mais que croyaient-ils chez Onetel, qu'avec une connexion illimitée les abonnés ne feraient que 20h ?)

- **Multimania se diversifie**

A partir d'Octobre, les membres de Multimania pourront diffuser gratuitement du contenu audio et vidéo sur leur site perso avec les technologie RealNetworks.

- **Cyber-police chinoise**

Début Août, la Chine a lancé sa police internet.

- **CD audio et MP3**

Ça y est, ils arrive en France ! Une société chinoise, A-Max va lancer mi-août le Napa DA V309 distribué par Bataca. Il s'agit d'un discman qui peut lire aussi bien les CD audio que les MP3. Son prix sera de 1300 F environ. (CONTQM : avant de vous ruer dessus, méfiez-vous, j'ai eu l'occasion de tester un modèle concurrent et le résultat n'était pas fameux.)

Dimanche 6 Août 2000

- **Les secrets d'Apple révélés par l'Abeille ouvrière**

Apple a demandé une enquête judiciaire suite aux révélations faites concernant son prochain portable iBook. Un inconnu a en effet publié sur le web des informations concernant sa nouvelle souris optique et un PowerMac biprocesseur avant leur présentation le mois dernier. Worker Bee, c'est son nom, aurait aussi dévoilé un troisième produit que la firme à la pomme n'a toujours pas présenté, qui serait une version de l'iBook équipée d'un processeur plus rapide. Apple a donc sommé le portail Yahoo! de révéler les informations les informations qu'il possède sur worker bee puisque celui-ci a fait ses révélations sur GeoCities (qui appartient à Yahoo!).

- **Publicité pour l'échange de fichiers**

La décision de fermer Napster a doublé les connexions au site. Le soir de la fermeture du site, le nombre de connexions a été porté à 849196, contre 443070 la veille. Il a ainsi dépassé la fréquentation de sites comme Amazon.com. De plus les sites de téléchargement enregistre une hausse importante des demandes de logiciels d'échange de fichier.

- **Le Limousin n'est pas rentable**

Le Conseil régional dénonce la disparition de la notion de service public. En effet, le Limousin fait partie zones que Completel a jugé non rentables pour l'utilisation la boucle radio locale pour l'Internet.

- **Le mobile tue ?**

Un procès va s'ouvrir aux États-Unis suite à la plainte d'un médecin estimant

que sa tumeur cérébrale est due à son téléphone cellulaire. Au Royaume-Uni, le gouvernement s'est lancé dans une campagne pour inciter les enfants à ne pas utiliser les cellulaires. Pendant ce temps des études sont toujours en cours pour déterminer si oui ou non il y a danger.

- **IBM et Micro\$oft pour un standard**

Les deux compagnies ont décidé de collaborer pour définir des standards internet, concernant notamment le XML pour simplifier le développement de leurs applications futures.

- **Dessins animés sur PDA**

Cela pourrait arriver bientôt... Warner Brothers et Sony Pictures sont en train de tester la possibilité de distribuer, par le biais d'Internet, des dessins animés sur ce support.

- **Le Conseil constitutionnel censure**

Le Conseil constitutionnel a apporté des modifications à la loi sur la liberté de communication, notamment en censurant d'office l'article concernant la responsabilité pénale des hébergeurs, déclarant anticonstitutionnelle la saisie par un tiers.

- **La Dram Rambus double sa vitesse**

Une RDRAM 1066 MHz, avec une bande passante de 2,1 Go/s, voilà la dernière avancée du constructeur de mémoire. La technique ? La même que celle de la DDR SDRAM : le doublement de la fréquence (2*533 MHz).

- **Vous jouerez plus tard**

La sortie en Europe de la Playstation 2 a été retardée, vraisemblablement pour pouvoir répondre à la demande en Amérique du Nord.

- **Alerte aux virus**

McAfee a créé un service qui vous envoie les formations sur les nouveaux virus directement sur votre téléphone WAP.

- **Téléchargement de musique autorisés**

Cette semaine Universal lance son service de téléchargement de musique imitant ainsi Sony et EMI. BMG et Time Warner s'y mettront d'ici la fin de l'année

Vendredi 4 Août 2000

- **Opérateurs téléphone : US vs UE**

Près de 50 compagnies de téléphone européennes se sont jointes à la campagne de l'Union Européenne pour stopper la proposition de loi américaine visant à empêcher, entre autres, Deutsche Telekom de s'offrir Voicestream.

- **Micro\$oft a chaud**

L'Union Européenne a officiellement lancé à son tour une procédure antitrust contre Micro\$oft. Du coup, MS incite un juge à renvoyer plus de 60 actions en cours aux États-Unis pour avoir les mains un peu plus libres

Jeudi 3 Août 2000

- **Le GMT ne sera pas la référence**

Tony Blair s'était engagé dans une campagne pour que Greenwich soit le point de référence de l'horloge internet avec le GeT (Greenwich Electronic Time). Mais le système basé sur Java est incompatible avec Internet Explorer, donc avec près de 80% d'internautes, les tests montrant des écarts allant jusqu'à 9s. (Si quelqu'un peut m'expliquer l'intérêt de créer une heure Internet alors qu'il existe déjà une heure de référence, qu'il m'envoie un mail, merci).

- **Offres d'emploi**

Comme tous les ans, le week-end dernier s'est tenu à Las Vegas le DefCon, le congrès de hackers (NPLN : ceux qui forcent les systèmes informatiques protégés). Depuis quelques années, les hackers invitent même officiellement des agents fédéraux aux conférences. En effet, auparavant, ils cherchaient à s'infiltrer incognito et un jeu avait été lancé, "Spot the Fed" qui consistait pour les hacker à démasquer ces agents. Cette année, les fédéraux (un officier du ministère de la Défense, un membre d'une cellule discrète proche de la C.I.A.) ont même été invités à s'exprimer sous forme de conférences et de tables rondes (nommées "Meet the Fed"). Le dernier jour, "Spot the Fed" a sorti aussi un gros poisson, un agent de la NSA. Leurs interventions ont eu un point commun, la tentative à peine voilée de recruter des hackers pour les services de renseignement américains.

Par contre, interrogés à ce sujet, ils ont démenti l'existence du réseau d'espionnage Echelon.

- **Ils ne liront pas grand chose**

Selon les analyses d'un chercheur universitaire, le dispositif de surveillance des mails, qui sera mis en place au Royaume-Uni serait techniquement obsolète. Il ne prendrait pas en charge les serveurs de mail étrangers, ni certains petits FAI britanniques, oubliés par le dispositif, les accès internet à haut débit, ni avec le nouveau protocole internet IPv6 (futur standard du web). Un gaspillage de 200 millions de francs.

- **IBM gonfle ses disques**

D'ici deux ans, les disques durs devraient dépasser les 200 Go. Alors que la technologie holographique, lorsqu'elle sera au point, devrait pouvoir permettre d'atteindre 1 Go par cm², IBM propose une technologie intermédiaire basée sur un système de stockage nano-mécanique composé de milliers de micropointes. Il permet de stocker 1,25 Go sur une surface de 3 millimètres carrés comprenant

32 x 32, soit 1024 micropointes qui réagissent à l'électricité et adoptent un état levé (1) ou baissé (0). On devrait donc pouvoir atteindre 500 milliards de bits par pouce carré, soit 5 fois la densité maximale pouvant être atteinte sur support magnétique, celle-ci étant estimée à 100 (les disques les plus récents ont une densité de 12 milliards de bits au pouce carré).

- **Etudes / Sondages**

Sondage Sofres : Seuls 7 % des internautes de l'Hexagone ont acheté en ligne au cours des derniers mois, contre 27 % des Américains ayant accès au net.

- **WebTV Basque**

Ce mois-ci va s'ouvrir TVPI.fr une web T.V. locale privée du Pays proposant 20% de programmes en langue basque.

Mercredi 2 Aout 2000

- **Du nouveau dans l'échange de fichiers**

La startup Autonomous Zone ose ce qu'aucune n'avait fait auparavant, vous payer pour échanger des fichiers ! Le concept est simple : on reprend le système de Napster étendu à tous types de fichiers, avec son moteur de recherche et tout et tout, sauf que quand quelqu'un télécharge un fichier depuis votre ordinateur, vous recevez des Mojos, une monnaie inventée par la startup mais convertible en dollars (1 mojo = 1/1000 cent).

On pourrait donc s'attendre à revoir le même genre de manoeuvre judiciaire que contre Napster, d'autant plus que certains sites pornographiques majeurs comme Penthouse seraient de la partie. Mais les créateurs de la société sont confiants, assurant qu'on ne peut leur demander de supprimer des références illégales puisque leur système, contrairement à Napster, ne mémorise pas l'index des fichiers. De plus, ils affirment vouloir travailler avec Hollywood sur un système de paiement volontaire nommé PayLars (en référence à Lars Ulrich, batteur de Metallica à l'origine de poursuites contre Napster).

MojoNation, c'est le nom du logiciel, sera déjà disponible en version beta au salon des Hackers, le DefCon. Le logiciel pourrait de plus reprendre le système de Freenet qui sauvegarde les fichiers sur son serveur, les rendant téléchargeables même après la déconnexion du fournisseur. De plus vous aurez un formulaire à remplir, pour pouvoir établir une liste des fournisseurs de fichiers de confiance (le même système de notation que sur les sites de ventes aux enchères). Pour gagner des Mojos, vous pourrez aussi vendre une partie de votre bande passante, de l'espace disque pour servir de serveur ou créer d'autres services payants.

- **Le futur de Napster**

Napster a entamé une série de rencontre avec EMusic qui pourrait aboutir à un partenariat, lequel pourrait affecter la décision de la cour sur l'action en justice en cours.

- **Red Hat a convaincu Ericsson**

Les efforts soutenus de Red Hat pour faire entrer Linux dans les petits appareils non-PC portent enfin leurs fruits puisque la firme vient de signer un accord de partenariat avec Ericsson.

- **Le Net "s'installe" en Iran et Irak**

En Iran, c'est le premier centre rural connecté au web et en Irak, le premier premier cyber-café

Mardi 1^{er} Août 2000

- **URL plus simple**

Suite à une étude montrant que les utilisateurs de téléphone Wap devaient taper 70 touches en moyenne pour entre une adresse, la société Bango a mis au point un système d'URL par chiffres pour simplifier la tâche. Il se nomme le Bango Number et vous permet de taper un numéro (3 chiffres min) en lieu et place de l'adresse. Maintenant, la course est lancée pour acheter les numéros, les plus chers étant bien sur ceux de 3 chiffres.

- **Quand on a de l'argent...**

Micro\$oft compte dépenser 500 millions de \$ pour le marketing et la vente de sa future console de Xbox, le plus gros budget jamais atteint par la firme pour lancer un nouveau produit.

- **Vous êtes espionnés...**

L'info n'est pas nouvelle, mais cette fois, un cabinet d'étude a utilisé un renifleur de paquet pour savoir quelles informations étaient recueillies à notre insu et le résultat est sidérant.

Ce cabinet a téléchargé des données depuis son propre site. En résumé, les serveurs de Real, AOL ou Netzip récupèrent le nom du fichier (exécutable) téléchargé, l'adresse exacte du serveur de provenance, l'adresse IP de l'ordinateur de l'internaute. Le logiciel crée une clé d'identification à partir du nom de la machine lors de l'installation de Windows . Couplé à un cookie, il permet par exemple de créer un historique des fichiers téléchargés. Lisible en hexadécimal et en équivalent ASCII, le fichier ne laisse guère de doute sur les risques de son exploitation.

- **On joue dans le comique**

Le premier patch correctif pour Windows 2000 US est sorti : 83 Mo (version française pour le 10 Août). Après le patch pour office de plus de 100 Mo, les logiciels de MS coûtent plus cher en téléphone qu'à l'achat si on les veut à jour !

- **Du cinéma avec la Playstation**

Sony a lancé le GScube. C'est un outil de développement pour l'industrie cinématographique et la création multimédia.... basé sur la technologie PlayStation 2.

Si vous avez appris une nouvelle importante à diffuser :

News: August 2000

Abbreviations used: NPLN - > Note For The Beginners, CONTQM - > This Opinion Is due Only To Me

Thursday 31 Août 2000

- **Ca does not have anything of surprising...**

The Promis software, which had made much speak about him in the Eighties is a software intended for the lawyers who classifies the documents and to establish correlations between them. It has had for summer improved by the American administration which resold it, under another name, abroad, with secret service (in Jordan and Israel, in particular) but also at companies, of which some large French banks.

However, the modifications would have consisted of the installation of devices of listening and intrusion on the computers where it would be installed, thus giving to the United States the possibility of espionner a great number of companies and government agencies. Just there, all goes well for American except that the Canadian government which uses software PIRS to coordinate the investigations as of the its secret service and assembled Police force, suspects that it is one of these version of Promised. An investigation was thus open to determine if informers exist well.

- **France Telecom does not have the Yellow Pages.**

France Telecom, which has www.pagesjaunes.fr, had required of the World Office of the Patent rights (OMPI) to rule in its favour on the question of knowing to which belong the pagesjaunes.com fields, pagesjaunes.net and lespagesjaunes.com. But the OPMI did not follow while explaining in particular that other named directories Yellow Pages exist in French-speaking countries with the name pagesjaunes.ch, ca, be, lu.

- **Everyone is entitled to an e-mail... 2nd edition**

The Post office announced that it was going to offer a free e-mail to each French, who is consultable directly of on your premise (on the site or your manager of malls) or on paying terminals in the stations. Only here is, the service has existed for one year....

- **Sony leaves its Palm**

Sony and Palm revealed Clie, first PDA resulting from their alliance which marks the entry of the Japanese on this growing market.

- **The rumours are specified**

The Mainsoft company, Unix/Linux developer, are suspected of being one of the pillars of the conversion of Office under Linux. It already carried I.E. and Windows Media Player on this platform. (CONTQM: If one finds even software ms under Linux, which will be the interest to preserve Windows?)

- **AGP x8 for INTEL**

Medium 2001, INTEL should leave this new graphic bus which will make it possible to still accelerate the 3d.

- **New system of promotion**

In the United States (elsewhere I do not know), Windows Me (NPLN: Windows Millenium, which leaves the 14/09 everywhere in the world) will be distributed in the form of demonstrations in the department stores.

Wednesday August 30, 2000

- **New friends of Napster**

Many organizations provided supports of Napster before the Court of Appeal, such as for example Consuming it Electronics Association (ECA) and the DIGITAL Media Association (DiMA).

The ECA estimates that the judge badly interpreted the case of Betamax of Sony of 1984 bus Napster has, in its eyes, created a new standard which can have legal applications although it is often used for enfreindre the law. DiMA which represents more than 960 ntreprises whose AOL and Yahoo joined the positions of the ECA.

- **Barbie makes confidence with the small girls**

The directors of Barbie.com engaged 26 small girls between 6 and 12 years to help them to reconsider the site which had been open this summer. Every week these girls received by mail of the photographs of screen of the site in construction and were questioned by e-mail or telephone. Of course they received a remuneration (not communicated) for their services.

It seems that this way of proceeding is paying since the traffic doubled with the reopening of the site then quadrupled after publicities with the T.V.. Moreover, the visitors are fidélisent. The visitor remains each time 26 mn on average.

- **Freesurf sanctions subscribers**

According to the road traced by OneTel, Freesurf registered on a black list and disconnected from the subscribers of the unlimited fixed price evening and weekend to have broken the rules. According to conditions' of the fixed price with 100 F/mois, the subscriber is restricts with the consultation of the Web and its malls and with the newsgroups. But 531 subscribers were disconnected in

one week, without notice and by not having inevitably enfreint the rules. They are shown to have used footbridges to download software.

On the fact that there were errors and not notice, the director of Freesurf explains "that it was about an emergency measure. But we realized that some practise were regarded wrongly as frauds." They are thus in the train examining the cases one by one for reconnecter those which were disconnected by error.

Among the raised technical errors, an subscriber who would quite simply introduce CD into his PC and would launch the software of WinAmp reading while being connected would be regarded as a defrauder bus WinAmp uses a protocol prohibited by the unlimited fixed price.

Freesurf however supports to want to continue its offer of unlimited access.

- **The antenna-relays would be dangerous**

According to a study ordered by the review Science and Future, the vibrations which transmit the radio operator signals of mobile telephony would be definitely more harmful than the operators declare it.

The study, carried out in fifteen apartments of Island-of-France located behind a antenna-relay or on the last floor of a building by accomodating one, reveals that in nearly two cases out of three, the intensity of emitted radiations is ten times higher than the values announced by the laboratories of France Telecom.

Already, in April 1999 already, the general direction of health and the secretariat of State to housing had published a report recommending a "restriction of use total or partial" of the balconies of HLM on which these antennas are installed, and even a "judgment of certain rooms".

- **Released INTEL**

The PIII 1,13 GHz was withdrawn from sale 1 month after its exit because of an anomaly on an involving circuit of the problems of operation with certain software. Moreover certain assemblers as Dell had already suspended their orders because of the incapacity of INTEL required this model in a sufficient number. During this time, AMD launched its Athlon 1,1 GHz and it has already more than 10 manufacturers like customers, in particular Compaq, Fujitsu Siemens Computers, Gateway, Hewlett-Packard and IBM.

AMD is thus alone on the top-of-the-range crenel and its product is less expensive. INTEL provides that the modifications to be made to the design of its PIII will take a few months..... as much to say an eternity considering the given rhythm processors with 1,5 GHz are awaited before long.

- **Amazon.com Creates Amazon.fr**

The opening took place in the night from the 30 to August 31. The site will propose 4 shops (books, music, DVD and video) which would propose the whole of the references available in France. However, contrary to its competitors, no figure was given for the French products whereas one knows those of the foreign products (240.000 CD references in importation, 700.000 English books). For the prices, the site will conform to the French regulation into force on the flat price of the book.

Not having been able to repurchase Alapage (France Telecom was faster),

Amazon has to build a site of any part but knew to be surrounded by a team made up of old from Vivendi, Havas or the FNAC. But competitors, the FNAC, Alapage and BOWL do not worry and even think that the publicity campaign which Amazon will launch will be beneficial for them.

- **Between Netscape and I.E., choose K-Meleon**

It acts as a free navigator and under licence G.P.L. (NPLN: the source code of the software is available and modifiable at will by all one each one) which resembles I.E. but which integrates the engine of Gecko interpretation, which will be in the heart of Netscape 6. There is thus there a lighter clone (4 Mo) of Netscape Navigator, it will thus interest: all those which want to have the navigators of Microsoft and Netscape, the developers of Web sites wishing to ensure itself of the appearance of a site in the two versions or the Net surfers wanting to go on inaccessible sites with I.E..

For the familiar ones of the Unix/Linux world, it is during Windows de Galeon (which integrates already Gecko).

- **The last version of ms Office is in test**

Office 10 will include a new technology of voice recognition, an additional support XML, an application of collaboration by Internet and the management tools of the contents.

- **The new one on Palms**

A programmer created the first Trojan horse known for Palm...

Tuesday 29 Août 2000

- **Virus for the children**

That has just left! If you receive an e-mail with Pikachu (Pokemon!) in attached file, do not click above. These is a new virus which trails on the Net.

- **Motorola throws sponge on Iridium**

That made a few times that that brooded... For lack of repreneur, Motorola decided to scuttle the 66 satellites of its network of mobile telephony. Here how to throw 7 billion \$ easily!

- **Pentium IV grew bigger**

One has to expect that INTEL has evil required Pentium IV and that he is expensive. Indeed, the small new one contains 42 million transistors (against 28 for the PIII), that is to say a surface of 217 mm² (against a hundred on the PIII). They will be produced with same technologies as the PIII but because of its size, INTEL will be able to assemble only one by silicon wafer of them where it assembled two PIII at the same time. Calculation is thus very simple: speed of production reduced by half and raw material cost doubled... which becomes the final price?

With medium term, the problem of surface should be tiny room with the

passage to technology 0,13 micron and the use of wafers of 300 mm against 200 currently.

A processor named Foster should follow. It is about a PIV for waiters and workstations

- **Counteract of INTEL**

INTEL also revealed the XScale technology which aims at controlling consumption and thermal release and which presents many similarities with the processor of Transmeta.

- **Bugé PGP**

PGP (Pretty Good Privacy), the reference as regards encoding would suffer from a bug which, under certain conditions makes it possible to reach, in the Windows versions, with the decoded data.

- **Micro\$oft bouche les trous**

Une faille dans FrontPage Server Extensions rendait possibles les attaques du type Denial of Service. Microsoft aurait corrigé le problème.

- **Rumeurs**

Il semblerait que Micro\$oft fasse développer par une firme israélienne une version de sa suite Office pour Linux. MS a bien sûr démenti la rumeur.

- **Oracle gratuit**

La firme a lancé OracleSalesOnline.com, un service qui offrira, le logiciel de base d'automatisation de la force de vente gratuitement. Seuls les modules additionnels seront payants, comme le logiciel de "sales-compensation", selon un système de pay-per-use (paiement à l'utilisation).

- **TrustE perd en crédibilité**

Le sceau TrustE est en temps normal une marque de garantie de la confidentialité sur des sites marchands. Mais l'organisation aurait fait profiter une société des données de ses visiteurs.

- **Yahoo veut crypter**

Yahoo prévoit de permettre aux utilisateurs de ses services mail de crypter leurs messages en utilisant le site SecureDelivery.com. Il serait le premier à proposer cette option.

- **Microsoft a des problèmes avec Hotmail**

Des utilisateurs Hotmail ont expliqué que suite à la fermeture de leur compte pour cause d'inactivité (ce qui est normal) ils ont créé un nouveau compte avec le même nom d'utilisateur et ont découvert avec étonnement que leur liste de contacts AIM était maintenue sur leur nouveau compte. Conclusion, si quelqu'un crée un compte avec votre ancien pseudo, il récupère votre liste de contact. Micro\$oft enquêterait de manière approfondie sur la question.

- **Nintendo se donne du temps**

Le Gameboy Advance ne sortira qu'en Mars au Japon et en Juillet en Europe à cause de ruptures de stocks en composants qui sont dus en grande partie à la forte demande actuelle en Gameboys Color

- **Du nouveau chez les cellulaires**

Suite à la polémique sur les dangers des cellulaires en matière de radiation, les principaux constructeurs ont décidé d'indiquer sur les emballages la quantité de radiations émises par leurs appareils

Mercredi 23 Août 2000

- **Dure concurrence pour Intel**

AMD (le grand rival) et Transmeta (l'étoile montante) devraient annoncer un coopération technologique. Transmeta est très intéressé par la technologie LDT (Lightning Data Transfer) créée par AMD qui accélère les échanges de données entre le processeur et les différents composants du PC et qui sera intégré aux jeux de composants des Athlon en 2001. Cette technologie permettrait à Transmeta d'atteindre le GHz. De son côté, AMD aurait accès à la technologie de Transmeta, dont les processeurs consomment 50 % d'énergie en moins que ses concurrents à fréquence égale.

Cette alliance ne va pas faire le bonheur d'Intel qui perd des parts de marché et patauge entre ses problèmes avec les composants i820 et les retards sur le Pentium IV, d'autant plus qu'AMD sera bientôt sur tous les fronts : portables (Athlon mobile fin 2000), ordinateurs de bureau (Athlon Thunderbird 1,2 GHz), serveurs (Sledgehammer).

- **Premier cyber hold-up**

Egg, la banque britannique uniquement on-line a été électroniquement "braquée". Selon la banque, aucune perte (quelques dizaines de milliers de £) n'a été subie. Le 3 malfaiteur présumés ont été arrêté après une enquête de 6 mois suite à une alerte de Egg qui dispose de logiciels permettant de repérer tout ordinateur à partir duquel sont effectuées des opérations multiples.

- **Faites vos courses**

Uranium Online est un site qui vous permet d'acheter des barres de combustible nucléaire en ligne...

- Selon une étude de NetValue, 575000 heures auraient été consacrées aux jeux d'argent en ligne au mois de juillet.

- **Radio France est web-actif**

Mi septembre, Radio France va sortir la première de ses Webradios thématiques. Ce sera "la radio du livre".

Mardi 22 Août 2000

- **Le philippin s'en sort bien**

Le gouvernement Philippin, faute de loi adaptée, a décidé abandonner les charges retenues contre l'auteur présumé du virus 'I Love You', ce qui ne fait pas la joie des américains.

- **Gadget inutiles**

Sous prétexte de l'explosion des nouvelles technologies ont veut nous faire acheter n'importe quoi...

Philips, en collaboration avec Levi's va sortir en France en Septembre des blousons avec écouteurs intégrés et prises pour connecter téléphones mobiles et lecteur MP3.

- **Le Xeon suit le mouvement**

Le Xeon, processeur haute performance d'Intel va lui aussi être très bientôt porté à 1 GHz

- **On ne s'arrête plus d'accélérer**

Cette semaine, Intel a dévoilé cette semaine sont pentium IV. Les analystes estiment qu'il devrait atteindre les 10 GHz d'ici 4 ans.

Le fondeur a aussi annoncé la sortie de nouveaux processeurs pour serveurs et pour ordinateurs de poche.

- **Un de moins**

MP3.com avait 4 procès pour violation de copyrights sur le dos, il n'y en a plus que 3. Le site vient de conclure un accord avec Sony qui lui permettra de distribuer la musique du producteur.

- **Reality Run : fin de la course**

La semaine dernière je vous parlais de la chasse à l'homme organisée en Allemagne, Roger, le fugitif, a été rattrapé au bout de 7 jours par la chasseuse de prime qui empoche 10000 \$ au passage. Si vous êtes intéressés vous pouvez faire acte de candidature. Les prochains sites, pour lesquels votent les internautes, pourraient être Vienne ou Amsterdam.

Lundi 21 Août 2000

- **Altavista U.K. renonce**

C'est tombé lundi, le patron d'Altavista U.K. a annoncé que le forfait illimité ne se ferait pas (au passage je corrige ce que j'ai dit la semaine dernière, le forfait était de 60 £ / an). Il a prétexté que c'était de la faute de British Telecom qui ne lui avait pas proposé de forfait comme prévu mais des tarifications à la minute. Et British Telecom de dire que ce n'est pas de sa faute, blah, blah, blah.... Bref fin d'une aventure qui n'avait pas commencé.

- **Forfait illimité de OneTel**

L'Association des Internautes Médiateurs (ADIM) a demandé l'assignation en référé de OneTel pour tout le flou et les nombreux revirements ayant entouré le forfait illimité de l'opérateur (hésitations de la hotline, accusations de fraude, les connexions impossibles,...)

- **Les prochains processeurs d'Intel**

On en sait un peu plus sur la prochaine série d'Intel : Les vitesses débiteront à 1,4 GHz et ils seront basés sur une nouvelle architecture pour accélérer la vitesse de streaming et faciliter le travail peer-to-peer (égal à égal) en réseau.

- **AMD marque un point**

C'est n'est pas sur le plan de la vitesse des processeurs ou AMD est toujours à 1,1 GHz et Intel à 1,13 mais sur celui des prix. AMD a décidé de casser les prix des Athlon et Duron a titre d'exemple aux ÉtatsUnis :

Intel Pentium III 850 MHz (256K L2 Cache, 100 MHz FSB, Slot 1): 454 \$

AMD Athlon 850 MHz (512K L2 Cache, 200 MHz FSB, Slot A) : 239 \$

A ce prix là, y'a pas photo pour le choix... Mais pour les inconditionnels d'Intel, pas de panique, on peut raisonnablement penser qu'il suivra.

- **Nokia fonctionnera en Open-Source**

Nokia a sorti son nouveau navigateur internet pour téléphone cellulaire. La firme a décidé de laisser le code en Open-Source en espérant ainsi marquer des points le marché des logiciels "sans fils".

- **Compaq remporte un gros contrat ?**

Compaq devrait normalement emporter un contrat avec le Ministère de l'énergie américain pour un super-ordinateur de simulation des armes nucléaires.

Dimanche 20 Août 2000

- **Premier agrément pour mobile monétique**

C'est Sagem qui a été le premier à obtenir, pour un terminal GSM monétique, l'agrément EMV délivré par Europay International. C'est un téléphone de la gamme Sagem 900 qui vient de recevoir cet agrément. Il pourra donc être utilisé pour payer avec sa carte bancaire (Mastercard ou Visa) à distance, y compris pour des paiements internationaux, en toute sécurité. Ce téléphone est associé à une batterie monétique disposant du coupleur carte à puce, associé à une application située dans la carte SIM de l'opérateur. Sagem a déjà enregistré plus de 500000 commandes.

- **Protégez-vous des ondes mobiles**

Alors que la polémique fait rage pour savoir si oui ou non et dans quelle mesure les téléphones mobiles sont dangereux pour la santé, la société japonais Gunze vient de mettre au point un T-shirt, le "Pace protector", qui protège des ondes

électromagnétiques en en supprimant jusqu'à 92%. En fait, il a été conçu pour les porteurs de stimulateur cardiaque. Il est tissé en fil de nylon argenté et est efficace même à 2 cm du pacemaker. Son prix, 1640 F.

- **Les grosses dépenses de France Telecom**

C'est maintenant les dans les licences UMTS belges et suédoises que FT a décidé d'investir.

Pour la Suède c'est par le biais de sa filiale Orange et en collaboration avec Skanska (groupe du bâtiment) et la Swedish Broadband Company.

En Belgique, c'est la filiale Mobistar qui va au charbon. L'acquisition, si elle se fait, sera payée par l'endettement et une augmentation du capital. De plus FT envisage que la filiale de Mobistar, Mobistar Corporate Solutions fusionne avec Global One, le groupe de services de communication pour grandes entreprises acquis en début d'année..... par France Telecom.

- **Saut quantique pour les ordinateurs**

(Attention, je vais parler un peu technique, pour ceux qui n'auront pas tous compris -essayez quand même-, dites vous que c'est plus d'une dizaine d'années de théories et d'expériences qui commence à montrer des signes de "réalisabilité")

Bienvenue dans le monde du spin nucléaire et des enchevêtrements subatomiques. Les chercheurs d'IBM ont montré que l'ordinateur quantique, dont on parle depuis de nombreuses années, est réalisable et devrait largement distancer les meilleurs super-ordinateurs. Ils ont annoncé qu'il avaient utilisé "l'ordinateur quantique le plus moderne au monde" pour résoudre en une étape un problème mathématique alors qu'il en faudrait 4 avec un ordinateur conventionnel. On espère pouvoir ainsi surpasser l'architecture silicium en utilisant notamment le fait qu'une particule subatomique peut exister dans deux états quantiques apparemment opposés. Bien sûr, l'ordinateur d'IBM, ne tient pas dans la poche. Il occupe une demi pièce pleine d'électro-aimants et de spectromètres.

Le cœur du système est constitué de 5 atomes de fluor, chacun représentant un unique "bit quantique" ou "qubit" de capacité de stockage en suspension dans une molécule spécialement conçue pour. Lorsqu'on lui applique un champ magnétique, le noyau au centre des atomes peut être mis en rotation rapide de façon mesurable et contrôlable, en utilisant l'Imagerie de Résonance Magnétique (IRM, comme en médecine). Chaque noyau en rotation interagit avec les autres, créant un "enchevêtrement" qui défie logiquement les lois quantiques et que les chercheurs peuvent dompter pour effectuer des calculs à une vitesse phénoménale. Isaac Chuang, leader du projet ordinateur quantique chez IBM souligne que "c'est la première fois qu'une équipe réussit un calcul en utilisant une molécule de 5 qubit". Cependant il ne faut pas s'attendre à voir les premières applications commerciales d'ordinateurs quantiques avant au moins 20 ans.

Chez H.P., on salue les avancées d'IBM qui sont considérées comme "impressionnantes et encourageantes". Mais la firme, elle, travaille sur un type

plus conventionnel d'ordinateur super-rapide et à faible consommation pour lequel ils s'attendent à pouvoir produire des résultats d'ici 5 ans. D'autres voies explorées sont celles de l'ordinateur biologique construit à partir d'ADN ou d'ordinateurs pour lesquels on utiliserait des réactions chimiques pour assembler des composants encore plus petits.

- **Linuxiens, choisissez votre camp**

De grandes compagnies se sont associées dans la Gnome Foundation pour soutenir Gnome l'une des deux interfaces graphiques les plus utilisées sous Linux. Ce groupe dirigera le projet et décidera quels packages doivent être inclus dans Gnome. Les sociétés impliquées sont, entre autres, Sun Microsystems, VA Linux Systems, Collab.Net, Compaq Computer and IBM plus celles qui sont directement impliquées dans le projet : Red Hat, Gunitais, Henzai, Eazel et Hélix Code. Ajoutez à cela des participation de la Free Software Foundation (pionnière dans le logiciel open-source) et l'Object Management Group (qui s'attache à créer des programme qui communiquent ensemble de façon standard).

Ceci ne va pas aller dans le sens de l'unification avec le compétiteur principal, KDE, qui est utilisé dans les distributions de SuSE, Corel, Caldera, Red Hat, sur les ordinateurs Linux d'IBM. Cette séparation entre les deux grands est dangereuse parce que les programmeurs auront à choisir entre les deux pour assurer la compatibilité de leurs logiciels.

Sun Microsystems va adopter l'interface Gnome pour ses système d'exploitation Solaris et fournira plus de 50 programmeurs au projet Gnome. De plus, StarOffice (le pendant de Micro\$oft Office sous Linux), appartient à Sun est sera donc plus étroitement lié à Gnome. La suite adoptera Bonobo, une technologie Gnome similaire au logiciel Microsoft COM qui permet à un programme d'utiliser les composants d'un autre (par exemple, un gestionnaire de mail peut utiliser le moteur Gecko de Netscape ou un Messenger Instantané utiliser le correcteur d'orthographe de StarOffice).

- **La démocratie en danger**

Les américains nous auront tout fait ! La commission électorale fédérale américaine a découvert que des votes avaient été mis aux enchères sur eBay. Et les enchères (sérieuses ou non) variaient de 5 à 10000 \$. Averti, eBay a supprimé les offres.

D'autres, comme le site Vote Auction vont plus loin, tentant d'ériger l'idée en système. Derrière le site, James Baumgartner, un étudiant qui a fait de Voteauction son sujet de thèse. « De toute façon, explique-t-il , c'est le candidat le mieux pourvu financièrement qui gagne quasiment à tous les coups. » S'il ne s'adresse pas directement aux candidats, le site ouvre ses enchères aux entreprises qui financent d'ordinaire les campagnes. L'analyse rejoint celle d'un internaute qui tente de vendre son vote aux enchères sur Yahoo. « Les sénateurs vendent régulièrement leur vote au plus offrant, avance-t-il, Pourquoi le citoyen américain serait-il exclu du système ? »

Samedi 19 Août 2000

- **Marijuana Express**

iToke, un site hollandais compte lancer à Amsterdam un service de livraison de marijuana à domicile.

- **Netscape Communicator 4.75**

Je sais, il y a eu la version 4.74 le mois dernier, mais si cette nouvelle mise-à-jour sort si vite après c'est qu'elle contient le correctif permettant de réparer le trou de sécurité, dont je vous parlais la semaine dernière, Brown Orifice.

- **AMD n'oublie pas Linux**

AMD recrute actuellement des développeurs Linux pour écrire des logiciels pour le Sledgehammer, son processeur 64 bits qui devrait sortir courant 2001. La firme a créé un site web pour les développeurs Linux et enverra aux participant un "simulateur de technologie" du processeur pour que les entreprises puissent commencer à faire migrer leurs systèmes d'exploitation et logiciels. Et il parait que ce n'est qu'un début...

- **IBM fait la promotion de SuSE**

Big Blue fournira une version CD de la distribution Linux de Suse avec chacun des serveurs Intel qu'il vend en Europe. SuSE estime que cette collaboration devrait lui permettre de faire essayer sa technologie à 20000 clients potentiels.

- **AOL sur Linux ?**

Un site web (<http://www.techpages.com>) propose une pré-version non-officielle d'AOL pour Linux. son nom de code : Gamera. Certaines sources proches d'AOL auraient confirmé que le logiciel est authentique...

- **Corel Linux Second edition**

La première version a fait un pas important dans la simplification de l'installation de Linux mais il semble que cette nouvelle version fassent encore mieux.

- **I Love You Again**

Quelques firmes Américaines et Européenne ont été touchées par une nouvelle version du ver "I Love You" (VBS/Loveletter.bd), il s'agit notamment de banques. Cette nouvelle mouture télécharge et lance un programme nommé "hcheck.exe" qui qui récupère les mots de passe stockés sur l'ordinateur infecté.

- **Sony sur de nouveaux créneaux**

Le Walkman a fait son succès, Sony a donc décidé d'ici la fin de l'année, de sortir une nouvelle ligne de walkmans MP3. Mais ce ne sera pas tout, la firme sortira aussi d'autres appareils internet et des téléphones cellulaires.

- **Un PDA change le cours d'un procès**

Aux Etats-Unis, un procès pour meurtre va devoir être recommencé parce qu'un

des jurés a lu des commentaires sur le procès sur son PalmPilot.

- **Transmeta accroche un nouveau gros contrat**

Vaio, c'est la gamme d'ultraportables de Sony. Ils étaient jusqu'à présent équipé d'un Celeron 366. Mais la nouvelle gamme C1 sera, elle, équipée d'un Crusoë de chez Transmeta. C'est la faible consommation électrique et la dissipation thermique réduite qui fait basculer le choix de Sony vers le nouveau venu. En effet, le Crusoë consommerait 1 Watt (0,02 en mode veille) contre 15 à 20 pour les Celeron.

Après le contrat signé avec IBM, il ne manque plus que Toshiba au tableau de chasse de Transmeta pour avoir toutes les grosses pointures du monde de l'ordinateur portable.

- **Hallucinant !**

Pour faire sa promotion, un site internet offre 5000 \$ au 10 premiers bébés qui porteront légalement son nom.

- **Webmasters, attention !**

Un éditeur de site a été condamné par la justice américaine pour un lien qui renvoyait vers le code source du DeCSS, logiciel illégal permettant de pirater les DVD. Ce cas pourrait faire jurisprudence.

- **Tuez à distance**

Columbo va avoir du fil a retordre... L'Institut de technologie thaïlandais King Mongkut a présenté un robot armé qui détecte les intrus grâce à une caméra et des capteurs. Vous passez un ordre par Internet et il tire.

Jeudi 17 Août 2000

- **Chasse à l'homme**

Les allemands ont lancé un nouveau jeu le 14/08 : un chasse à l'homme dans Berlin en direct sur le WebLe fugitif, Roger, enseignant en Hollande. Sur ses traces Jack Black, chasseur de primes qui gagnera 10000 \$ s'il rattrape Roger. Roger porte sur lui une webcam et un micro pour que les internautes puissent tout suivre sur le Net et n'a le droit qu'à 2 h de répit par jour dans une cache secrète. Pour être sûr que le fugitif n'attend pas patiemment la fin dans une chambre d'hôtel, il doit suivre un parcours quotidien qui passe par des lieux connus de Berlin qu'il doit prendre en photo. Ensuite, il doit laisser les photos (en format numérique) sur un banc ou collé à une poubelle pour que les organisateurs les récupèrent.

Les internautes ne doivent pas participer physiquement à la chasse mais peuvent aider Roger ou Jack sur le Net. Soit dit en passant Roger n'est pas discret puisqu'il porte un tee-shirt aux couleurs du site.

Le jeu, qui enregistre 600000 pages vues par jour doit durer 24 jours et recommencer ensuite avec un nouveau candidat. S'il en réchappe, Roger gagnera 100000 \$!

<http://www.realityrun.com> (le site est aussi en anglais)

- **Nouveau problème de sécurité**

Un nouvel utilitaire internet permet de scanner l'IIS (Internet Information Server) de Microsoft, découvrir ses points de vulnérabilité et lancer une attaque qui peut révéler les nom et mots de passe des utilisateurs. Et c'est sur ce système serveur que Microsoft veut faire migrer MSN Messenger !!!!

- **Va-t-il se casser les dents ?**

Malgré les déboires de ses prédécesseurs, un nouveau FAI se lance dans l'internet illimité. AOL vous proposera, dès lundi, ce service 24h/24 pour 99 F par mois. La contrepartie, vous vous engagez pour 24 mois. (CONTQM : ceux qui il y a un an se sont engagé avec un abonnement d'un an chez AOL pour avoir des prix plus bas se sont mordus les doigts avec l'arrivée des FAI gratuits, est-ce le moment de recommencer ? 2 ans, en matière d'informatique, c'est très long. Tout peut arriver...)

- **L'escroc Altavista**

Le portail a annoncé un forfait illimité en Grande-Bretagne pour 60 £/mois. Il a ensuite affirmé que les inscription se ferait par lots de 25000 par semaine pour ne pas engorger le service. Le Mirror a donc mené l'enquête pour trouver des internautes qui profitent de ce service (ils devraient être 100000 à l'heure actuelle) et pas moyen d'en trouver un seul. Et bizarrement, seul le PDG d'Altavista U.K. peut s'exprimer sur la question, lequel passe des vacances qui n'en finissent plus de s'allonger. Pourquoi un portail de cette envergure aurait-il tenté une telle escroquerie ? Nous en saurons plus après les vacances du PDG...

- **Contenus payants**

Realnetworks, la firme propriétaire du célèbre RealPlayer a annoncé le lancement aux États-Unis d'un forfait payant qui permettra d'accéder à des programmes exclusifs chaque mois.

Mercredi 16 août 2000

- **Stinger le nouvel OS de Micro\$oft**

Non, ce n'est pas le successeur de Windows ME c'est tout simplement l'OS que Micro\$oft a conçu pour les téléphones cellulaires. Il s'agit d'une version réduite de Windows CE. Il propose, en plus des fonctions de téléphonies, un agenda intelligent qui peut forcer le téléphone à vibrer plutôt qu'à sonner aux heures de réunion et fonctionner en relation avec Outlook, et peut gérer l'affichage couleur. Samsung, s'est déjà montré intéressé par le système. Micro\$oft travaille par ailleurs sur un OS supplémentaire destiné, celui-là, à équiper les téléphones permettant d'accéder à Internet.

Tout cela ne sera pas de trop pour faire face à la montée en puissance programmée de Java et Linux sur toutes ces petites machines

- **Zapstation**

On pensait avoir tout vu ? Voici la Zapstation. C'est une sorte de console qui se branche sur votre T.V.. Elle offre un accès Web, lit les fichiers MP3, les CD et les DVD, télécharge des vidéos, reçoit les radios mondiales... Elle embarque une disque dur de 30 Go, utilise un Celeron 566 Mhz et peut-être reliée à une imprimante, un baladeur, tout type de périphérique informatique classique, à un ampli. Vous l'utilisez grâce à une télécommande et un clavier sans fil. Elle sera disponible vers Novembre.

<http://www.zapmedia.com>

- **SVG version finale**

SVG signifie Scalable Vector Graphics et s'appuie sur le langage XML. Ceci garantit donc une indépendance vis-à-vis des plates-formes. Il est indépendant de la résolution de l'écran et peut intégrer des textes descriptifs. De plus il permet de créer des liens vers des zones de l'images sans avoir à la mapper. Le gros problème est qu'aucun navigateur ne supporte évidemment ce format pour l'instant. Seul Adobe propose de télécharger un plug-in.

- **m100, le nouveau Palm**

Il devait être moins cher, c'est le cas aux États-Unis (150\$) mais en France il sera à 1500 F (comme le Palm III). Le nouveautés ? Son capot devient amovible (les nouveaux, disponibles en 4 couleurs, coûtent tout de même 200 F pièce !) et il possède un petit hublot qui permet de voir l'heure même capot fermé. Il est plus petit que la série III, faisant perdre à l'écran 1/4 de sa surface et une nouvelle touche permet d'accéder directement au bloc-note. La synchronisation avec l'ordinateur se fait maintenant directement par câble plutôt qu'avec une station d'accueil. Il fonctionne sous Palm OS 3.5 et emporte 2 petits Mo de mémoire.

- **Nouvelle folie japonaise**

Après le Tamagoshi dans la poche voici les nouveaux venus. Ce sont de petites créatures virtuelles qui s'occupent de vous livrer vos mails. Vous devez donc vous en occuper comme leurs prédécesseurs mais la lecture de votre courrier dépendra leur bonne volonté. Il paraît que les japonais en sont fous.

[La version Sony de la chose](#)

-

Un rapport de Forrester Research conclue que les standards open-source (NPLN : logiciel dont le code est accessible à tout un chacun, comme c'est le cas de Linux par exemple) domineront l'industrie du logiciel d'ici 4 ans. Il ajoute aussi qu'IBM et Dell devraient tirer leur épingle du jeu tandis que Oracle et Microsoft auront à batailler ferme pour s'en sortir.

-

Ce sont les enfants de moins de 11 ans qui cliquent le plus sur les bannières de pubs et les adolescents qui cliquent le moins (soit dit en passant, et moi jamais).

- **Vite !**

Le ministère de la Justice américain veut "expédier" le passage de l'appel de Micro\$oft devant la Cour Suprême parce que ce procès "a une importance extrême pour [leur] économie nationale" (sic).

- **La Banque de France soutient Napster....**

... malgré elle. En effet, un pirate a squatté la page d'accueil d'une trentaine de sites dont celui de la BNF

Mardi 15 Août 2000

- **Bonne blague**

Les clients Londoniens de Safeway, une chaîne britannique de supermarchés ont eut une jolie surprise. Ceux-ci ont reçu un message leur annonçant une hausse des prix et leur conseillant de faire leurs courses ailleurs. La firme n'a toujours pas pu déterminer où était la faille.

Lundi 14 Août 2000

- **Musique mobile protégée**

Intel et Matsushita ont lancé conjointement un système de protection des contenus numériques pour protéger par exemple la musique. Il n'est sûrement pas compatible avec Napster

- **e-commerce Visa ou rien**

Les vendeurs on-line vont devoir les respecter les règles établies par Visa concernant l'e-commerce ou aller voir ailleurs...

- **Un de plus chez Linux**

C'est au tour de Linux, après Dell et IBM de faire de Linux un de ses 3 systèmes d'exploitation stratégiques.

- **e-book par Micro\$oft**

Barnes and Nobles, une chaîne de librairies américaines (deuxième librairie en ligne, loin derrière Amazon.com) et MS lancent le plus gros service de vente de livres électroniques.

Micro\$oft en profite pour glisser Reader 1.5, son logiciel gratuit qui optimise l'affichage des e-Books sur un écran d'ordinateur de bureau ou un PDA, offre des options de recherche de mots, de surlignage ou encore de marque-page. 2000 eBook sont déjà disponibles dans ce format sur le site de Barnes and Noble et 150 titres supplémentaires devraient s'ajouter chaque mois. De plus MS propose d'autres applications dont un programme interagissant dans Word qui permet de convertir un document au format livre électronique et une autre

firme, Overdrive propose un logiciel permettant de faire la même chose à partir d'un document HTML ou d'un fichier texte.

A suivre, les plaintes des éditeurs en réponse à la création de moteurs d'échange d'e-books qui ne sauraient tarder à apparaître.

- **PSX 2 fin novembre**

La Playstation 2 ne sera disponible en France que le 24 novembre pour un prix d'environ 3000 F

- **Un standard de messagerie instantanées**

L'Internet Engineering Task Force va examiner 3 propositions de technologies pour définir un standard de messagerie instantanée. La proposition d'AOL, jugée peu innovante a déjà été rejetée (CONTQM : c'est bien mais pourvu que la technologie retenue n'appartienne pas à Microsoft non plus mais plutôt à une firme encore indépendante)

- **Apache 2.0 arrive**

D'ici la fin de l'année, la version 2 d'Apache, l'application serveur web la plus utilisée dans le monde, devrait être terminée pour la fin de l'année.

- **Hotmail sous Win2000**

Microsoft a décidé de ne plus faire appel au monde du logiciel libre, soit ; mais Hotmail, son service de messagerie instantanée fonctionne sous Apache et FreeBSD ! MS va donc être obligé de le faire migrer sous Windows 2000. (CONTQM : quelque chose me dit que le service sera moins performant !)

- **Le web parlera**

Le W3C (World Wide Web Consortium) travaille sur le SSML (Speech Synthesis Markup Language), une extension du XML (eXtended Markup Language) qui devrait permettre d'intégrer des instructions de synthèse vocale aux contenus textuels du Web permettant de faire des sites interrogeables par téléphone.

- **La chine sous Linux**

L'administration chinoise tournera sous Linux. elle affirme vouloir ainsi "briser le monopole de Windows et des technologies étrangères".

- **Windows is back**

La marine américaine avait renoncé à conserver Windows NT sur ses navires parce qu'il avait tendance à planter. Mais cela ne l'empêche pas d'avoir décidé d'installer une version spécifique de Windows 2000 sur ses nouveaux porte-avions.

- **Carnivore suite**

Le ministère de la Justice américain emploiera une université pour conduire une analyse indépendante du système d'espionnage des mails du FBI : Carnivore.

- **Le 64 bits d'AMD**

Le manuel technique du Sledgehammer, le processeur 64 bits d'AMD a été publié cette semaine. Ce processeur devrait être à la fois capable de gérer les programmes prévus pour les processeurs 32 bits (comme le PIII ou l'Athlon) et les programmes pour les processeurs 64 bits (comme l'UltraSparc de Sun, l'Alpha de Compaq ou le futur Itanium d'Intel).

Vendredi 11 Août 2000

- **Record du monde ?**

La femme la plus "téléchargée" du monde serait Danni Ashe. C'est du moins ce qu'essaye d'établir en ce moment le Livre Guinness des Records. Elle revendique 800 millions de téléchargements. Si vous voulez voir de qui il s'agit : <http://www.dannisharddrive.com/> (pour ceux qui ne s'en seraient pas doutés, il est recommandé d'être âgé de plus de 18 ans !)

- **Un soutien pour Napster...**

...et pas des moindres. Celui qui se faisait dernièrement appeler Prince dit sur son site que Napster est "un développement passionnant dans l'histoire de la musique" et en profite pour critiquer violemment le patron de Time Warner.

- **Poussez-les d'un côté, ils reviennent de l'autre.**

AOL cherche à faire figure propre concernant les MP3 en déconnectant un site de recherche de MP3. Cependant, la firme doit encaisser la sortie d'un nouveau logiciel d'échange de fichiers qui permet aux utilisateurs d'AOL messenger d'accéder à un réseau type Napster.

Pour ceux que ça intéresse, il se nomme AIMSTER et vous pouvez le trouver à : <http://www.aimster.com/>

Jeudi 10 Août 2000

- **Please stop...**

Le Pentagone a lancé un appel aux hackers, les suppliant d'arrêter de s'en prendre à ses réseaux... pour des raisons de sécurité.

- **Un Net-piège...**

Chapeau pour les douanes américaines ! 400 internautes qui espéraient pouvoir accéder à une chaîne satellite américaine à des prix défiant toute concurrence sont en fait tombés dans un piège tendu par les douanes.

- **Le trou de Netscape**

Le trou de sécurité des versions de Netscape antérieures à la version 6 a été dénommé BrownOrifice (petite allusion à son cousin dévastateur BackOrifice). Vous pouvez tester son mode de fonctionnement sur ce site qui lui est dédié : <http://www.brumleve.com/BrownOrifice/>. Ne vous inquiétez pas, je vous

rappelle que c'est sans risque pour votre système si ce n'est qu'on peut parcourir votre disque, sans pour autant pouvoir modifier quoi que ce soit.

La meilleure façon de se prémunir contre cette défaillance du système : désactiver les applet Java, en attendant le patch sur lequel travaille Netscape.

Mercredi 9 Août 2000

- **Après les MP3 et les fichiers multimédia, les jeux**

Swapoo, www.swapoo.com, est un site qui suit le chemin tracé par Napster mais il concerne les échanges de jeux pour consoles.

- **La chasse aux pirates est ouverte**

C'est la nouvelle occupation de Micro\$oft. La firme fait appel à la délation par le biais d'une hot-line et d'un service e-mail mais elle s'est aussi équipée d'outils de recherche automatique pour localiser sur le web les logiciels piratés ou vendus à prix suspect sur les sites web, ftp et de chat.

Un moteur de recherche scrute 24h sur 24 le web a cet effet. Micro\$oft compte ainsi recueillir des milliers d'adresses par jour. Afin de contacter immédiatement les sites ou FAI hébergeurs.

MS est soutenu par la Business Software Alliance, association d'éditeurs dont Microsoft est le principal promoteur.

Parallèlement, MS a aussi nommé un responsable aux affaires gouvernementales pour pousser l'administration américaine à mettre la pression sur les États pirates (la Russie et la Chine notamment).

Les éditeurs américains estiment perdre 150 milliards de francs par an du fait du piratage.

- **Netscape fait fort !**

Les navigateurs Netscape permettraient de voir le contenu de votre disque dur et ceci grâce à un applet Java présent sur certains sites.

Mardi 8 Août 2000

- **Un pingouin au poignet**

Les chercheurs d'IBM ont installé le Système d'exploitation Linux dans une montre-bracelet pour démontrer que le système pouvait être utilisé même dans les plus petits appareils.

- **Transmeta première version**

Transmeta a lancé la production de ses processeurs Crusoe chez Taiwan Semiconductor Manufacturing et d'autres fondeurs ce qui pourrait être le début d'une longue série...

- **Onetel raccroche**

Après la suspension des accès illimités, Onetel a décidé de limiter la consommation des abonnés qui y ont souscrit. (CONTQM : Mais que croyaient-ils chez Onetel, qu'avec une connexion illimitée les abonnés ne feraient que 20h ?)

- **Multimania se diversifie**

A partir d'Octobre, les membres de Multimania pourront diffuser gratuitement du contenu audio et vidéo sur leur site perso avec les technologie RealNetworks.

- **Cyber-police chinoise**

Début Août, la Chine a lancé sa police internet.

- **CD audio et MP3**

Ça y est, ils arrive en France ! Une société chinoise, A-Max va lancer mi-août le Napa DA V309 distribué par Bataca. Il s'agit d'un discman qui peut lire aussi bien les CD audio que les MP3. Son prix sera de 1300 F environ. (CONTQM : avant de vous ruer dessus, méfiez-vous, j'ai eu l'occasion de tester un modèle concurrent et le résultat n'était pas fameux.)

Dimanche 6 Août 2000

- **Les secrets d'Apple révélés par l'Abeille ouvrière**

Apple a demandé une enquête judiciaire suite aux révélations faites concernant son prochain portable iBook. Un inconnu a en effet publié sur le web des informations concernant sa nouvelle souris optique et un PowerMac biprocesseur avant leur présentation le mois dernier. Worker Bee, c'est son nom, aurait aussi dévoilé un troisième produit que la firme à la pomme n'a toujours pas présenté, qui serait une version de l'iBook équipée d'un processeur plus rapide. Apple a donc sommé le portail Yahoo! de révéler les informations les informations qu'il possède sur worker bee puisque celui-ci a fait ses révélations sur GeoCities (qui appartient à Yahoo!).

- **Publicité pour l'échange de fichiers**

La décision de fermer Napster a doublé les connexions au site. Le soir de la fermeture du site, le nombre de connexions a été porté à 849196, contre 443070 la veille. Il a ainsi dépassé la fréquentation de sites comme Amazon.com. De plus les sites de téléchargement enregistre une hausse importante des demandes de logiciels d'échange de fichier.

- **Le Limousin n'est pas rentable**

Le Conseil régional dénonce la disparition de la notion de service public. En effet, le Limousin fait partie zones que Completel a jugé non rentables pour l'utilisation la boucle radio locale pour l'Internet.

- **Le mobile tue ?**

Un procès va s'ouvrir aux États-Unis suite à la plainte d'un médecin estimant

que sa tumeur cérébrale est due à son téléphone cellulaire. Au Royaume-Uni, le gouvernement s'est lancé dans une campagne pour inciter les enfants à ne pas utiliser les cellulaires. Pendant ce temps des études sont toujours en cours pour déterminer si oui ou non il y a danger.

- **IBM et Micro\$oft pour un standard**

Les deux compagnies ont décidé de collaborer pour définir des standards internet, concernant notamment le XML pour simplifier le développement de leurs applications futures.

- **Dessins animés sur PDA**

Cela pourrait arriver bientôt... Warner Brothers et Sony Pictures sont en train de tester la possibilité de distribuer, par le biais d'Internet, des dessins animés sur ce support.

- **Le Conseil constitutionnel censure**

Le Conseil constitutionnel a apporté des modifications à la loi sur la liberté de communication, notamment en censurant d'office l'article concernant la responsabilité pénale des hébergeurs, déclarant anticonstitutionnelle la saisie par un tiers.

- **La Dram Rambus double sa vitesse**

Une RDRAM 1066 MHz, avec une bande passante de 2,1 Go/s, voilà la dernière avancée du constructeur de mémoire. La technique ? La même que celle de la DDR SDRAM : le doublement de la fréquence (2*533 MHz).

- **Vous jouerez plus tard**

La sortie en Europe de la Playstation 2 a été retardée, vraisemblablement pour pouvoir répondre à la demande en Amérique du Nord.

- **Alerte aux virus**

McAfee a créé un service qui vous envoie les formations sur les nouveaux virus directement sur votre téléphone WAP.

- **Téléchargement de musique autorisés**

Cette semaine Universal lance son service de téléchargement de musique imitant ainsi Sony et EMI. BMG et Time Warner s'y mettront d'ici la fin de l'année

Vendredi 4 Août 2000

- **Opérateurs téléphone : US vs UE**

Près de 50 compagnies de téléphone européennes se sont jointes à la campagne de l'Union Européenne pour stopper la proposition de loi américaine visant à empêcher, entre autres, Deutsche Telekom de s'offrir Voicestream.

- **Micro\$oft a chaud**

L'Union Européenne a officiellement lancé à son tour une procédure antitrust contre Micro\$oft. Du coup, MS incite un juge à renvoyer plus de 60 actions en cours aux États-Unis pour avoir les mains un peu plus libres

Jeudi 3 Août 2000

- **Le GMT ne sera pas la référence**

Tony Blair s'était engagé dans une campagne pour que Greenwich soit le point de référence de l'horloge internet avec le GeT (Greenwich Electronic Time). Mais le système basé sur Java est incompatible avec Internet Explorer, donc avec près de 80% d'internautes, les tests montrant des écarts allant jusqu'à 9s. (Si quelqu'un peut m'expliquer l'intérêt de créer une heure Internet alors qu'il existe déjà une heure de référence, qu'il m'envoie un mail, merci).

- **Offres d'emploi**

Comme tous les ans, le week-end dernier s'est tenu à Las Vegas le DefCon, le congrès de hackers (NPLN : ceux qui forcent les systèmes informatiques protégés). Depuis quelques années, les hackers invitent même officiellement des agents fédéraux aux conférences. En effet, auparavant, ils cherchaient à s'infiltrer incognito et un jeu avait été lancé, "Spot the Fed" qui consistait pour les hacker à démasquer ces agents. Cette année, les fédéraux (un officier du ministère de la Défense, un membre d'une cellule discrète proche de la C.I.A.) ont même été invités à s'exprimer sous forme de conférences et de tables rondes (nommées "Meet the Fed"). Le dernier jour, "Spot the Fed" a sorti aussi un gros poisson, un agent de la NSA. Leurs interventions ont eu un point commun, la tentative à peine voilée de recruter des hackers pour les services de renseignement américains.

Par contre, interrogés à ce sujet, ils ont démenti l'existence du réseau d'espionnage Echelon.

- **Ils ne liront pas grand chose**

Selon les analyses d'un chercheur universitaire, le dispositif de surveillance des mails, qui sera mis en place au Royaume-Uni serait techniquement obsolète. Il ne prendrait pas en charge les serveurs de mail étrangers, ni certains petits FAI britanniques, oubliés par le dispositif, les accès internet à haut débit, ni avec le nouveau protocole internet IPv6 (futur standard du web). Un gaspillage de 200 millions de francs.

- **IBM gonfle ses disques**

D'ici deux ans, les disques durs devraient dépasser les 200 Go. Alors que la technologie holographique, lorsqu'elle sera au point, devrait pouvoir permettre d'atteindre 1 Go par cm², IBM propose une technologie intermédiaire basée sur un système de stockage nano-mécanique composé de milliers de micropointes. Il permet de stocker 1,25 Go sur une surface de 3 millimètres carrés comprenant

32 x 32, soit 1024 micropointes qui réagissent à l'électricité et adoptent un état levé (1) ou baissé (0). On devrait donc pouvoir atteindre 500 milliards de bits par pouce carré, soit 5 fois la densité maximale pouvant être atteinte sur support magnétique, celle-ci étant estimée à 100 (les disques les plus récents ont une densité de 12 milliards de bits au pouce carré).

- **Etudes / Sondages**

Sondage Sofres : Seuls 7 % des internautes de l'Hexagone ont acheté en ligne au cours des derniers mois, contre 27 % des Américains ayant accès au net.

- **WebTV Basque**

Ce mois-ci va s'ouvrir TVPI.fr une web T.V. locale privée du Pays proposant 20% de programmes en langue basque.

Mercredi 2 Aout 2000

- **Du nouveau dans l'échange de fichiers**

La startup Autonomous Zone ose ce qu'aucune n'avait fait auparavant, vous payer pour échanger des fichiers ! Le concept est simple : on reprend le système de Napster étendu à tous types de fichiers, avec son moteur de recherche et tout et tout, sauf que quand quelqu'un télécharge un fichier depuis votre ordinateur, vous recevez des Mojos, une monnaie inventée par la startup mais convertible en dollars (1 mojo = 1/1000 cent).

On pourrait donc s'attendre à revoir le même genre de manoeuvre judiciaire que contre Napster, d'autant plus que certains sites pornographiques majeurs comme Penthouse seraient de la partie. Mais les créateurs de la société sont confiants, assurant qu'on ne peut leur demander de supprimer des références illégales puisque leur système, contrairement à Napster, ne mémorise pas l'index des fichiers. De plus, ils affirment vouloir travailler avec Hollywood sur un système de paiement volontaire nommé PayLars (en référence à Lars Ulrich, batteur de Metallica à l'origine de poursuites contre Napster).

MojoNation, c'est le nom du logiciel, sera déjà disponible en version beta au salon des Hackers, le DefCon. Le logiciel pourrait de plus reprendre le système de Freenet qui sauvegarde les fichiers sur son serveur, les rendant téléchargeables même après la déconnexion du fournisseur. De plus vous aurez un formulaire à remplir, pour pouvoir établir une liste des fournisseurs de fichiers de confiance (le même système de notation que sur les sites de ventes aux enchères). Pour gagner des Mojos, vous pourrez aussi vendre une partie de votre bande passante, de l'espace disque pour servir de serveur ou créer d'autres services payants.

- **Le futur de Napster**

Napster a entamé une série de rencontre avec EMusic qui pourrait aboutir à un partenariat, lequel pourrait affecter la décision de la cour sur l'action en justice en cours.

- **Red Hat a convaincu Ericsson**

Les efforts soutenus de Red Hat pour faire entrer Linux dans les petits appareils non-PC portent enfin leurs fruits puisque la firme vient de signer un accord de partenariat avec Ericsson.

- **Le Net "s'installe" en Iran et Irak**

En Iran, c'est le premier centre rural connecté au web et en Irak, le premier premier cyber-café

Mardi 1^{er} Août 2000

- **URL plus simple**

Suite à une étude montrant que les utilisateurs de téléphone Wap devaient taper 70 touches en moyenne pour entre une adresse, la société Bango a mis au point un système d'URL par chiffres pour simplifier la tâche. Il se nomme le Bango Number et vous permet de taper un numéro (3 chiffres min) en lieu et place de l'adresse. Maintenant, la course est lancée pour acheter les numéros, les plus chers étant bien sur ceux de 3 chiffres.

- **Quand on a de l'argent...**

Micro\$oft compte dépenser 500 millions de \$ pour le marketing et la vente de sa future console de Xbox, le plus gros budget jamais atteint par la firme pour lancer un nouveau produit.

- **Vous êtes espionnés...**

L'info n'est pas nouvelle, mais cette fois, un cabinet d'étude a utilisé un renifleur de paquet pour savoir quelles informations étaient recueillies à notre insu et le résultat est sidérant.

Ce cabinet a téléchargé des données depuis son propre site. En résumé, les serveurs de Real, AOL ou Netzip récupèrent le nom du fichier (exécutable) téléchargé, l'adresse exacte du serveur de provenance, l'adresse IP de l'ordinateur de l'internaute. Le logiciel crée une clé d'identification à partir du nom de la machine lors de l'installation de Windows . Couplé à un cookie, il permet par exemple de créer un historique des fichiers téléchargés. Lisible en hexadécimal et en équivalent ASCII, le fichier ne laisse guère de doute sur les risques de son exploitation.

- **On joue dans le comique**

Le premier patch correctif pour Windows 2000 US est sorti : 83 Mo (version française pour le 10 Août). Après le patch pour office de plus de 100 Mo, les logiciels de MS coûtent plus cher en téléphone qu'à l'achat si on les veut à jour !

- **Du cinéma avec la Playstation**

Sony a lancé le GScube. C'est un outil de développement pour l'industrie cinématographique et la création multimédia.... basé sur la technologie PlayStation 2.

Si vous avez appris une nouvelle importante à diffuser :

Jeudi 31 Août 2000

- **Ca n'a rien de surprenant...**

Le logiciel Promis, qui avait beaucoup fait parler de lui dans les années 80 est un logiciel destiné aux juristes qui classe les documents et d'établir des corrélations entre eux. Il a depuis été retouché par l'administration américaine qui l'a revendu, sous un autre nom, à l'étranger, à des services secrets (en Jordanie et Israël, notamment) mais aussi à des sociétés, dont quelques grandes banques françaises.

Cependant, les modifications auraient consisté en la pose de dispositifs d'écoute et d'intrusion sur les ordinateurs où il serait installé, donnant ainsi aux États-Unis la possibilité d'espionner un grand nombre d'entreprises et d'agences gouvernementales. Juste là, tout va bien pour les américains sauf que le gouvernement canadien qui utilise le logiciel PIRS pour coordonner les enquêtes des ses services secrets et de la Police montée, soupçonne que ce soit une de ces version de Promis. Une enquête a donc été ouverte pour déterminer

si des mouchards existent bien.

- **France Telecom ne possède pas les Pages Jaunes.**

France Telecom, qui possède www.pagesjaunes.fr, avait demandé à l'Office Mondial de la Propriété Industrielle (OMPI) de statuer en sa faveur sur la question de savoir à qui appartiennent les domaines pagesjaunes.com, pagesjaunes.net et lespagesjaunes.com. Mais l'OMPI n'a pas suivi en expliquant notamment que autres annuaires nommés Pages Jaunes existent dans des pays francophones avec le nom pagesjaunes.ch, pagesjaunes.ca, pagesjaunes.be, pagesjaunes.lu.

- **Tout le monde a droit à un e-mail... 2ème édition**

La Poste a annoncé qu'elle allait offrir un e-mail gratuit à chaque français, qui est consultable directement de chez vous (sur le site ou sur votre gestionnaire de mails) ou sur des bornes payantes dans les postes. Seulement voilà, le service existe depuis un an....

- **Sony sort son Palm**

Sony et Palm ont dévoilé le Clie, premier PDA issu de leur alliance qui marque l'entrée du Japonais sur ce marché grandissant.

- **Les rumeurs se précisent**

La société Mainsoft, développeur Unix/Linux, est soupçonnée d'être l'un des piliers de la conversion d'Office sous Linux. Elle a déjà porté I.E. et Windows Media Player sur cette plate-forme. (CONTQM : Si on trouve même les logiciels MS sous Linux, quel sera l'intérêt de conserver Windows ?)

- **AGP x8 pour Intel**

Milieu 2001, Intel devrait sortir ce nouveau bus graphique qui permettra d'accélérer encore la 3D.

- **Nouveau système de promotion**

Au Etats-Unis (ailleurs je ne sais pas), Windows Me (NPLN : Windows Millenium, qui sort le 14/09 partout dans le monde) sera distribué sous forme de démos dans les grands magasins.

Mercredi 30 Août 2000

- **Les nouveau amis de Napster**

De nombreuses organisations se sont constituées soutiens de Napster devant la Cour d'appel, comme par exemple la Consumer Electronics Association (CEA) et la Digital Media Association (DiMA).

La CEA estime que le juge a mal interprété le cas du Betamax de Sony de 1984 car Napster a, à ses yeux, créé un nouveau standard qui peut avoir des applications légales bien qu'il soit souvent utilisé pour enfreindre la loi. La DiMA qui représente plus de 960 ntreprises dont AOL et Yahoo rejoint les positions de la CEA.

- **Barbie fait confiance aux petites filles**

Les directeurs de Barbie.com a engagé 26 petites filles entre 6 et 12 ans pour les aider à repenser le site qui avait été ouvert cet été. Toutes les semaines ces filles recevaient par mail des photos d'écran du site en construction et étaient questionnées par e-mail ou téléphone. Bien sûr elles ont reçu une rémunération (non communiquée) pour leurs services.

Il semble que cette façon de procéder soit payante puisque le trafic a doublé à la réouverture du site puis a quadruplé après les publicités à la T.V.. De plus, les visiteurs se fidélisent. Le visiteur reste à chaque fois 26 mn en moyenne.

- **Freesurf sanctionne des abonnés**

Suivant la route tracée par OneTel, Freesurf a inscrit sur une liste noire et déconnecté des abonnés du forfait illimité soir et week-end pour avoir brisé les règles. Selon les conditions du forfait à 100 F/mois, l'abonné est restreint à la consultation du web et de ses mails et aux groupes de discussions. Mais 531 abonnés ont été déconnectés en une semaine, sans préavis et en n'ayant pas forcément enfreint les règles. Ils sont accusés d'avoir utilisé des passerelles pour télécharger des logiciels.

Sur le fait qu'il y ait eu des erreurs et pas de préavis, le directeur de Freesurf explique "qu'il s'agissait d'une mesure d'urgence. Mais nous nous sommes rendus compte que certaines pratiques étaient considérées à tort comme des fraudes." Ils sont donc en train examiner les cas un par un pour reconnecter ceux qui ont été déconnectés par erreur. Parmi les erreurs techniques relevées, un abonné qui introduirait tout simplement un CD dans son PC et lancerait le logiciel de lecture WinAmp tout en étant connecté serait considéré comme un fraudeur car WinAmp utilise un protocole interdit par le forfait illimité. Freesurf soutient cependant vouloir poursuivre son offre d'accès illimité.

- **Les antennes-relais seraient dangereuses**

Selon une étude commandée par la revue Science et Avenir, les vibrations qui transmettent les signaux radio de téléphonie mobile seraient nettement plus nocives que les opérateurs ne le déclarent.

L'étude, réalisée dans quinze appartements d'Ile-de-France situés derrière une antenne-relais ou au dernier étage d'un immeuble en accueillant une, révèle que dans près de deux cas sur trois, l'intensité des radiations émises est dix fois supérieure aux valeurs annoncées par les laboratoires de France Telecom.

Déjà, en avril 1999 déjà, la direction générale de la santé et le secrétariat d'Etat au logement avaient publié un rapport préconisant une « restriction d'usage totale ou partielle » des balcons de HLM sur lesquels sont installées ces antennes, voire même une « condamnation de certaines pièces d'habitation ».

- **Intel largué**

Le PIII 1,13 GHz a été retiré de la vente 1 mois après sa sortie à cause d'une anomalie sur un circuit entraînant des problèmes de fonctionnement avec certains logiciels. De plus certains assembleurs comme Dell avaient déjà suspendu leurs commandes en raison de l'incapacité d'Intel à fournir ce modèle

en nombre suffisant. Pendant ce temps, AMD a lancé son Athlon 1,1 GHz et il a déjà plus de 10 constructeurs comme clients, notamment Compaq, Fujitsu Siemens Computers, Gateway, Hewlett-Packard et IBM.

AMD est donc seul sur le créneau haut de gamme et son produit est moins cher. Intel prévoit que les modifications à apporter au design de son PIII vont prendre quelques mois..... autant dire une éternité vu que les processeurs cadencés à 1,5 GHz sont attendus d'ici peu.

- **Amazon.com crée Amazon.fr**

L'ouverture a eu lieu dans la nuit du 30 au 31 août. Le site proposera 4 boutiques (livres, musique, DVD et vidéo) qui proposeraient l'ensemble des références disponibles en France. Cependant, contrairement à ses concurrents, aucun chiffre n'a été donné pour les produits français alors que l'on connaît ceux des produits étrangers (240.000 références de CD en import, 700.000 livres en anglais). Pour les prix, le site se conformera à la réglementation française en vigueur sur le prix unique du livre.

N'ayant pu racheter Alapage (France Telecom a été plus rapide), Amazon a du construire un site de toute pièce mais a su s'entourer d'une équipe composé d'anciens de chez Vivendi, Havas ou la FNAC. Mais les concurrents, la FNAC, Alapage et BOL ne s'inquiètent pas et pensent même que la campagne de publicité que va lancer Amazon va leur être bénéfique.

- **Entre Netscape et I.E., choisissez K-Meleon**

Il s'agit d'un navigateur gratuit et sous licence G.P.L. (NPLN : le code source du logiciel est disponible et modifiable à volonté par tout un chacun) qui ressemble à I.E. mais qui intègre le moteur d'interprétation Gecko, qui sera au coeur de Netscape 6. On a donc là un clone plus léger (4 Mo) de Netscape Navigator, il intéressera donc : tous ceux qui veulent disposer des navigateurs de Microsoft et de Netscape, les développeurs de sites web souhaitant s'assurer de l'apparence d'un site dans les deux versions ou les internautes voulant se rendre sur des sites inaccessibles avec I.E..

Pour les familiers du monde Unix/Linux, c'est le pendant Windows de Galeon (qui intègre déjà Gecko).

- **La dernière version de MS Office est en test**

Office 10 inclura une nouvelle technologie de reconnaissance vocale, un support XML additionnel, une application de collaboration par Internet et des outils de gestion du contenu.

- **Du nouveau sur les Palms**

Un programmeur a créé le premier Cheval de Troie connu pour Palm...

Mardi 29 Août 2000

- **Virus pour les enfants**

Ça vient de sortir ! Si vous recevez un e-mail avec Pikachu (le Pokemon !) en

fichier attaché, ne cliquez pas dessus. C'est un nouveau virus qui traîne sur le net.

- **Motorola jette l'éponge sur Iridium**

Ça faisait quelques temps que ça couvait... Faute de repeneur, Motorola a décidé de saborder les 66 satellites de son réseau de téléphonie mobile. Voilà comment jeter facilement 7 milliards de \$!

- **Pentium IV a grossi**

Il faut s'attendre à ce qu'Intel ait du mal à fournir le Pentium IV et qu'il soit cher. En effet, le petit nouveau contient 42 millions de transistors (contre 28 pour le PIII), soit une surface de 217 mm² (contre une centaine sur le PIII). Ils seront produits avec les mêmes technologies que le PIII mais du fait de sa taille, Intel ne pourra en monter qu'un par galette de silicium là où il montait deux PIII en même temps. Le calcul est donc très simple : vitesse de production réduite de moitié et coût de matière première doublé... que devient le prix final ?

A moyen terme, le problème de surface devrait être réduit avec le passage à la technologie 0,13 micron et l'utilisation de galettes de 300 mm contre 200 actuellement.

Un processeur nommé Foster devrait suivre. Il s'agit d'un PIV pour serveurs et stations de travail

- **Riposte d'Intel**

Intel a aussi dévoilé la technologie XScale qui vise à contrôler consommation et dégagement thermique et qui présente de nombreuses similitudes avec le processeur de Transmeta.

- **PGP buggé**

PGP (Pretty Good Privacy), la référence en matière de cryptage souffrirait d'un bug qui, dans certaines conditions permet accéder, dans les versions Windows, aux données décodées.

- **Micro\$oft bouche les trous**

Une faille dans FrontPage Server Extensions rendait possibles les attaques du type Denial of Service. Microsoft aurait corrigé le problème.

- **Rumeurs**

Il semblerait que Micro\$oft fasse développer par une firme israélienne une version de sa suite Office pour Linux. MS a bien sûr démenti la rumeur.

- **Oracle gratuit**

La firme a lancé OracleSalesOnline.com, un service qui offrira, le logiciel de base d'automatisation de la force de vente gratuitement. Seuls les modules additionnels seront payants, comme le logiciel de "sales-compensation", selon un système de pay-per-use (paiement à l'utilisation).

- **TrustE perd en crédibilité**

Le sceau TrustE est en temps normal une marque de garantie de la confidentialité sur des sites marchands. Mais l'organisation aurait fait profiter une société des données de ses visiteurs.

- **Yahoo veut crypter**

Yahoo prévoit de permettre aux utilisateurs de ses services mail de crypter leurs messages en utilisant le site SecureDelivery.com. Il serait le premier à proposer cette option.

- **Microsoft a des problèmes avec Hotmail**

Des utilisateurs Hotmail ont expliqué que suite à la fermeture de leur compte pour cause d'inactivité (ce qui est normal) ils ont créé un nouveau compte avec le même nom d'utilisateur et ont découvert avec étonnement que leur liste de contacts AIM était maintenue sur leur nouveau compte. Conclusion, si quelqu'un crée un compte avec votre ancien pseudo, il récupère votre liste de contact. Micro\$oft enquêterait de manière approfondie sur la question.

- **Nintendo se donne du temps**

Le Gameboy Advance ne sortira qu'en Mars au Japon et en Juillet en Europe à cause de ruptures de stocks en composants qui sont dus en grande partie à la forte demande actuelle en Gameboys Color

- **Du nouveau chez les cellulaires**

Suite à la polémique sur les dangers des cellulaires en matière de radiation, les principaux constructeurs ont décidé d'indiquer sur les emballages la quantité de radiations émises par leurs appareils

Mercredi 23 Août 2000

- **Dure concurrence pour Intel**

AMD (le grand rival) et Transmeta (l'étoile montante) devraient annoncer un coopération technologique. Transmeta est très intéressé par la technologie LDT (Lightning Data Transfer) créée par AMD qui accélère les échanges de données entre le processeur et les différents composants du PC et qui sera intégré aux jeux de composants des Athlon en 2001. Cette technologie permettrait à Transmeta d'atteindre le GHz. De son côté, AMD aurait accès à la technologie de Transmeta, dont les processeurs consomment 50 % d'énergie en moins que ses concurrents à fréquence égale.

Cette alliance ne va pas faire le bonheur d'Intel qui perd des parts de marché et patauge entre ses problèmes avec les composants i820 et les retards sur le Pentium IV, d'autant plus qu'AMD sera bientôt sur tous les fronts : portables (Athlon mobile fin 2000), ordinateurs de bureau (Athlon Thunderbird 1,2 GHz), serveurs (Sledgehammer).

- **Premier cyber hold-up**

Egg, la banque britannique uniquement on-line a été électroniquement

"braquée". Selon la banque, aucune perte (quelques dizaines de milliers de £) n'a été subie. Le 3 malfaiteur présumés ont été arrêté après une enquête de 6 mois suite à une alerte de Egg qui dispose de logiciels permettant de repérer tout ordinateur à partir duquel sont effectuées des opérations multiples.

- **Faites vos courses**

Uranium Online est un site qui vous permet d'acheter des barres de combustible nucléaire en ligne...

- Selon une étude de NetValue, 575000 heures auraient été consacrées aux jeux d'argent en ligne au mois de juillet.

- **Radio France est web-actif**

Mi septembre, Radio France va sortir la première de ses Webradios thématiques. Ce sera "la radio du livre".

Mardi 22 Août 2000

- **Le philippin s'en sort bien**

Le gouvernement Philippin, faute de loi adaptée, a décidé abandonner les charges retenues contre l'auteur présumé du virus 'I Love You', ce qui ne fait pas la joie des américains.

- **Gadget inutiles**

Sous prétexte de l'explosion des nouvelles technologies ont veut nous faire acheter n'importe quoi...

Philips, en collaboration avec Levi's va sortir en France en Septembre des blousons avec écouteurs intégrés et prises pour connecter téléphones mobiles et lecteur MP3.

- **Le Xeon suit le mouvement**

Le Xeon, processeur haute performance d'Intel va lui aussi être très bientôt porté à 1 GHz

- **On ne s'arrête plus d'accélérer**

Cette semaine, Intel a dévoilé cette semaine sont pentium IV. Les analystes estiment qu'il devrait atteindre les 10 GHz d'ici 4 ans.

Le fondeur a aussi annoncé la sortie de nouveaux processeurs pour serveurs et pour ordinateurs de poche.

- **Un de moins**

MP3.com avait 4 procès pour violation de copyrights sur le dos, il n'y en a plus que 3. Le site vient de conclure un accord avec Sony qui lui permettra de distribuer la musique du producteur.

- **Reality Run : fin de la course**

La semaine dernière je vous parlais de la chasse à l'homme organisée en Allemagne, Roger, le fugitif, a été rattrapé au bout de 7 jours par la chasseuse de prime qui empoche 10000 \$ au passage. Si vous êtes intéressés vous pouvez faire acte de candidature. Les prochains sites, pour lesquels votent les internautes, pourraient être Vienne ou Amsterdam.

Lundi 21 Août 2000

- **Altavista U.K. renonce**

C'est tombé lundi, le patron d'Altavista U.K. a annoncé que le forfait illimité ne se ferait pas (au passage je corrige ce que j'ai dit la semaine dernière, le forfait était de 60 £ / an). Il a prétexté que c'était de la faute de British Telecom qui ne lui avait pas proposé de forfait comme prévu mais des tarifications à la minute. Et British Telecom de dire que ce n'est pas de sa faute, blah, blah, blah.... Bref fin d'une aventure qui n'avait pas commencé.

- **Forfait illimité de OneTel**

L'Association des Internaute Médiateurs (ADIM) a demandé l'assignation en référé de OneTel pour tout le flou et les nombreux revirements ayant entouré le forfait illimité de l'opérateur (hésitations de la hotline, accusations de fraude, les connexions impossibles,...)

- **Les prochains processeurs d'Intel**

On en sait un peu plus sur la prochaine série d'Intel : Les vitesses débiteront à 1,4 GHz et ils seront basés sur une nouvelle architecture pour accélérer la vitesse de streaming et faciliter le travail peer-to-peer (égal à égal) en réseau.

- **AMD marque un point**

C'est n'est pas sur le plan de la vitesse des processeurs ou AMD est toujours à 1,1 GHz et Intel à 1,13 mais sur celui des prix. AMD a décidé de casser les prix des Athlon et Duron a titre d'exemple aux ÉtatsUnis :

Intel Pentium III 850 MHz (256K L2 Cache, 100 MHz FSB, Slot 1): 454 \$

AMD Athlon 850 MHz (512K L2 Cache, 200 MHz FSB, Slot A) : 239 \$

A ce prix là, y'a pas photo pour le choix... Mais pour les inconditionnels d'Intel, pas de panique, on peut raisonnablement penser qu'il suivra.

- **Nokia fonctionnera en Open-Source**

Nokia a sorti son nouveau navigateur internet pour téléphone cellulaire. La firme a décidé de laisser le code en Open-Source en espérant ainsi marquer des points le marché des logiciels "sans fils".

- **Compaq remporte un gros contrat ?**

Compaq devrait normalement emporter un contrat avec le Ministère de l'énergie américain pour un super-ordinateur de simulation des armes nucléaires.

Dimanche 20 Août 2000

- **Premier agrément pour mobile monétique**

C'est Sagem qui a été le premier à obtenir, pour un terminal GSM monétique, l'agrément EMV délivré par Europay International. C'est un téléphone de la gamme Sagem 900 qui vient de recevoir cet agrément. Il pourra donc être utilisé pour payer avec sa carte bancaire (Mastercard ou Visa) à distance, y compris pour des paiements internationaux, en toute sécurité. Ce téléphone est associé à une batterie monétique disposant du coupleur carte à puce, associé à une application située dans la carte SIM de l'opérateur. Sagem a déjà enregistré plus de 500000 commandes.

- **Protégez-vous des ondes mobiles**

Alors que la polémique fait rage pour savoir si oui ou non et dans quelle mesure les téléphones mobiles sont dangereux pour la santé, la société japonaise Gunze vient de mettre au point un T-shirt, le "Pace protector", qui protège des ondes électromagnétiques en en supprimant jusqu'à 92%. En fait, il a été conçu pour les porteurs de stimulateur cardiaque. Il est tissé en fil de nylon argenté et est efficace même à 2 cm du pacemaker. Son prix, 1640 F.

- **Les grosses dépenses de France Telecom**

C'est maintenant les dans les licences UMTS belges et suédoises que FT a décidé d'investir.

Pour la Suède c'est par le biais de sa filiale Orange et en collaboration avec Skanska (groupe du bâtiment) et la Swedish Broadband Company.

En Belgique, c'est la filiale Mobistar qui va au charbon. L'acquisition, si elle se fait, sera payée par l'endettement et une augmentation du capital. De plus FT envisage que la filiale de Mobistar, Mobistar Corporate Solutions fusionne avec Global One, le groupe de services de communication pour grandes entreprises acquis en début d'année..... par France Telecom.

- **Saut quantique pour les ordinateurs**

(Attention, je vais parler un peu technique, pour ceux qui n'auront pas tous compris -essayez quand même-, dites vous que c'est plus d'une dizaine d'années de théories et d'expériences qui commencent à montrer des signes de "réalisabilité")

Bienvenue dans le monde du spin nucléaire et des enchevêtrements subatomiques. Les chercheurs d'IBM ont montré que l'ordinateur quantique, dont on parle depuis de nombreuses années, est réalisable et devrait largement distancer les meilleurs super-ordinateurs. Ils ont annoncé qu'ils avaient utilisé "l'ordinateur quantique le plus moderne au monde" pour résoudre en une étape un problème mathématique alors qu'il en faudrait 4 avec un ordinateur conventionnel. On espère pouvoir ainsi surpasser l'architecture silicium en utilisant notamment le fait qu'une particule subatomique peut exister dans deux états quantiques apparemment opposés. Bien sûr, l'ordinateur d'IBM, ne tient pas

dans la poche. Il occupe une demi pièce pleine d'électro-aimants et de spectromètres.

Le coeur du système est constitué de 5 atome de fluor, chacun représentant un unique "bit quantique" ou "qubit" de capacité de stockage en suspension dans une molécule spécialement conçue pour. Lorsqu'on lui applique un champ magnétique, le noyau au centre des atomes peut être mis en rotation rapide de façon mesurable et contrôlable, en utilisant l'Imagerie de Résonance Magnétique (IRM, comme en médecine). Chaque noyau en rotation interagit avec les autres, créant un "enchevêtrement" qui défie logiquement les lois quantiques et que les chercheurs peuvent dompter pour effectuer des calculs à une vitesse phénoménale. Isaac Chuang, leader du projet ordinateur quantique chez IBM souligne que "c'est la premier fois qu'une équipe réussit un calcul en utilisant une molécule de 5 qubit". Cependant il ne faut pas s'attendre à voir les premières applications commerciales d'ordinateurs quantiques avant au moins 20 ans.

Chez H.P., on salue les avancées d'IBM qui sont considérées comme "impressionnantes et encourageantes". Mais la firme, elle, travaille sur un type plus conventionnel d'ordinateur super-rapide et à faible consommation pour lequel ils s'attendent à pouvoir produire des résultats d'ici 5 ans. D'autres voies explorées sont celles de l'ordinateur biologique construit à partir d'ADN ou d'ordinateurs pour lesquels on utiliserait des réactions chimiques pour assembler des composants encore plus petits.

- **Linuxiens, choisissez votre camp**

De grandes compagnies se sont associées dans la Gnome Foundation pour soutenir Gnome l'une des deux interfaces graphiques les plus utilisées sous Linux. Ce groupe dirigera le projet et décidera quels packages doivent être inclus dans Gnome. Les sociétés impliquées sont, entre autres, Sun Microsystems, VA Linux Systems, Collab.Net, Compaq Computer and IBM plus celles qui sont directement impliquées dans le projet : Red Hat, Gunitais, Henzai, Eazel et Hélix Code. Ajoutez à cela des participation de la Free Software Foundation (pionnière dans le logiciel open-source) et l'Object Management Group (qui s'attache à créer des programme qui communiquent ensemble de façon standard).

Ceci ne va pas aller dans le sens de l'unification avec le compétiteur principal, KDE, qui est utilisé dans les distributions de SuSE, Corel, Caldera, Red Hat, sur les ordinateurs Linux d'IBM. Cette séparation entre les deux grands est dangereuse parce que les programmeurs auront à choisir entre les deux pour assurer la compatibilité de leurs logiciels.

Sun Microsystems va adopter l'interface Gnome pour ses système d'exploitation Solaris et fournira plus de 50 programmeurs au projet Gnome. De plus, StarOffice (le pendant de Micro\$oft Office sous Linux), appartient à Sun est sera donc plus étroitement lié à Gnome. La suite adoptera Bonobo, une technologie Gnome similaire au logiciel Microsoft COM qui permet à un programme d'utiliser les composants d'un autre (par exemple, un gestionnaire de mail peut utiliser le moteur Gecko de Netscape ou un Messenger Instantané

utiliser le correcteur d'orthographe de StarOffice).

- **La démocratie en danger**

Les américains nous auront tout fait ! La commission électorale fédérale américaine a découvert que des votes avaient été mis aux enchères sur eBay. Et les enchères (sérieuses ou non) variaient de 5 à 10000 \$. Averti, eBay a supprimé les offres.

D'autres, comme le site Vote Auction vont plus loin, tentant d'ériger l'idée en système. Derrière le site, James Baumgartner, un étudiant qui a fait de **Voteauction** son sujet de thèse. « De toute façon, explique-t-il, c'est le candidat le mieux pourvu financièrement qui gagne quasiment à tous les coups. » S'il ne s'adresse pas directement aux candidats, le site ouvre ses enchères aux entreprises qui financent d'ordinaire les campagnes. L'analyse rejoint celle d'un internaute qui tente de vendre son vote aux enchères sur Yahoo. « Les sénateurs vendent régulièrement leur vote au plus offrant, avance-t-il, Pourquoi le citoyen américain serait-il exclu du système ? »

Samedi 19 Août 2000

- **Marijuana Express**

iToke, un site hollandais compte lancer à Amsterdam un service de livraison de marijuana à domicile.

- **Netscape Communicator 4.75**

Je sais, il y a eu la version 4.74 le mois dernier, mais si cette nouvelle mise-à-jour sort si vite après c'est qu'elle contient le correctif permettant de réparer le trou de sécurité, dont je vous parlais la semaine dernière, Brown Orifice.

- **AMD n'oublie pas Linux**

AMD recrute actuellement des développeurs Linux pour écrire des logiciels pour le Sledgehammer, son processeur 64 bits qui devrait sortir courant 2001. La firme a créé un site web pour les développeurs Linux et enverra aux participant un "simulateur de technologie" du processeur pour que les entreprises puissent commencer à faire migrer leurs systèmes d'exploitation et logiciels. Et il parait que ce n'est qu'un début...

- **IBM fait la promotion de SuSE**

Big Blue fournira une version CD de la distribution Linux de Suse avec chacun des serveurs Intel qu'il vend en Europe. SuSE estime que cette collaboration devrait lui permettre de faire essayer sa technologie à 20000 clients potentiels.

- **AOL sur Linux ?**

Un site web (<http://www.techpages.com>) propose une pré-version non-officielle d'AOL pour Linux. son nom de code : Gamera. Certaines sources proches d'AOL auraient confirmé que le logiciel est authentique...

- **Corel Linux Second edition**

La première version a fait un pas important dans la simplification de l'installation de Linux mais il semble que cette nouvelle version fassent encore mieux.

- **I Love You Again**

Quelques firmes Américaines et Européenne ont été touchées par une nouvelle version du ver "I Love You" (VBS/Loveletter.bd), il s'agit notamment de banques. Cette nouvelle mouture télécharge et lance un programme nommé "hcheck.exe" qui qui récupère les mots de passe stockés sur l'ordinateur infecté.

- **Sony sur de nouveaux créneaux**

Le Walkman a fait son succès, Sony a donc décidé d'ici la fin de l'année, de sortir une nouvelle ligne de walkmans MP3. Mais ce ne sera pas tout, la firme sortira aussi d'autres appareils internet et des téléphones cellulaires.

- **Un PDA change le cours d'un procès**

Aux Etats-Unis, un procès pour meurtre va devoir être recommencé parce qu'un des jurés a lu des commentaires sur le procès sur son PalmPilot.

- **Transmeta accroche un nouveau gros contrat**

Vaio, c'est la gamme d'ultraportables de Sony. Ils étaient jusqu'à présent équipé d'un Celeron 366. Mais la nouvelle gamme C1 sera, elle, équipée d'un Crusoë de chez Transmeta. C'est la faible consommation électrique et la dissipation thermique réduite qui fait basculer le choix de Sony vers le nouveau venu. En effet, le Crusoë consommerait 1 Watt (0,02 en mode veille) contre 15 à 20 pour les Celeron.

Après le contrat signé avec IBM, il ne manque plus que Toshiba au tableau de chasse de Transmeta pour avoir toutes les grosses pointures du monde de l'ordinateur portable.

- **Hallucinant !**

Pour faire sa promotion, un site internet offre 5000 \$ au 10 premiers bébés qui porteront légalement son nom.

- **Webmasters, attention !**

Un éditeur de site a été condamné par la justice américaine pour un lien qui renvoyait vers le code source du DeCSS, logiciel illégal permettant de pirater les DVD. Ce cas pourrait faire jurisprudence.

- **Tuez à distance**

Columbo va avoir du fil a retordre... L'Institut de technologie thaïlandais King Mongkut a présenté un robot armé qui détecte les intrus grâce à une caméra et des capteurs. Vous passez un ordre par Internet et il tire.

Jeudi 17 Août 2000

- **Chasse à l'homme**

Les allemands ont lancé un nouveau jeu le 14/08 : un chasse à l'homme dans Berlin en direct sur le WebLe fugitif, Roger, enseignant en Hollande. Sur ses traces Jack Black, chasseur de primes qui gagnera 10000 \$ s'il rattrape Roger. Roger porte sur lui une webcam et un micro pour que les internautes puissent tout suivre sur le Net et n'a le droit qu'à 2 h de répit par jour dans une cache secrète. Pour être sûr que le fugitif n'attend pas patiemment la fin dans une chambre d'hôtel, il doit suivre un parcours quotidien qui passe par des lieux connus de Berlin qu'il doit prendre en photo. Ensuite, il doit laisser les photos (en format numérique) sur un banc ou collé à une poubelle pour que les organisateurs les récupèrent.

Les internautes ne doivent pas participer physiquement à la chasse mais peuvent aider Roger ou Jack sur le Net. Soit dit en passant Roger n'est pas discret puisqu'il porte un tee-shirt aux couleurs du site.

Le jeu, qui enregistre 600000 pages vues par jour doit durer 24 jours et recommencer ensuite avec un nouveau candidat. S'il en réchappe, Roger gagnera 100000 \$!

<http://www.realityrun.com> (le site est aussi en anglais)

- **Nouveau problème de sécurité**

Un nouvel utilitaire internet permet de scanner l'IIS (Internet Information Server) de Microsoft, découvrir ses points de vulnérabilité et lancer une attaque qui peut révéler les nom et mots de passe des utilisateurs. Et c'est sur ce système serveur que Microsoft veut faire migrer MSN Messenger !!!!

- **Va-t-il se casser les dents ?**

Malgré les déboires de ses prédécesseurs, un nouveau FAI se lance dans l'internet illimité. AOL vous proposera, dès lundi, ce service 24h/24 pour 99 F par mois. La contrepartie, vous vous engagez pour 24 mois. (CONTQM : ceux qui il y a un an se sont engagé avec un abonnement d'un an chez AOL pour avoir des prix plus bas se sont mordus les doigts avec l'arrivée des FAI gratuits, est-ce le moment de recommencer ? 2 ans, en matière d'informatique, c'est très long. Tout peut arriver...)

- **L'escroc Altavista**

Le portail a annoncé un forfait illimité en Grande-Bretagne pour 60 £/mois. Il a ensuite affirmé que les inscription se ferait par lots de 25000 par semaine pour ne pas engorger le service. Le Mirror a donc mené l'enquête pour trouver des internautes qui profitent de ce service (ils devraient être 100000 à l'heure actuelle) et pas moyen d'en trouver un seul. Et bizarrement, seul le PDG d'Altavista U.K. peut s'exprimer sur la question, lequel passe des vacances qui n'en finissent plus de s'allonger. Pourquoi un portail de cette envergure aurait-il tenté une telle escroquerie ? Nous en saurons plus après les vacances du PDG...

- **Contenus payants**

Realnetworks, la firme propriétaire du célèbre RealPlayer a annoncé le lancement aux États-Unis d'un forfait payant qui permettra d'accéder à des

programmes exclusifs chaque mois.

Mercredi 16 août 2000

- **Stinger le nouvel OS de Micro\$oft**

Non, ce n'est pas le successeur de Windows ME c'est tout simplement l'OS que Micro\$oft a conçu pour les téléphones cellulaires. Il s'agit d'une version réduite de Windows CE. Il propose, en plus des fonctions de téléphonies, un agenda intelligent qui peut forcer le téléphone à vibrer plutôt qu'à sonner aux heures de réunion et fonctionner en relation avec Outlook, et peut gérer l'affichage couleur. Samsung, s'est déjà montré intéressé par le système. Micro\$oft travaille par ailleurs sur un OS supplémentaire destiné, celui-là, à équiper les téléphones permettant d'accéder à Internet.

Tout cela ne sera pas de trop pour faire face à la montée en puissance programmée de Java et Linux sur toutes ces petites machines

- **Zapstation**

On pensait avoir tout vu ? Voici la Zapstation. C'est une sorte de console qui se branche sur votre T.V.. Elle offre un accès Web, lit les fichiers MP3, les CD et les DVD, télécharge des vidéos, reçoit les radios mondiales... Elle embarque une disque dur de 30 Go, utilise un Celeron 566 Mhz et peut-être reliée à une imprimante, un baladeur, tout type de périphérique informatique classique, à un ampli. Vous l'utilisez grâce à une télécommande et un clavier sans fil. Elle sera disponible vers Novembre.

<http://www.zapmedia.com>

- **SVG version finale**

SVG signifie Scalable Vector Graphics et s'appuie sur le langage XML. Ceci garantit donc une indépendance vis-à-vis des plates-formes. Il est indépendant de la résolution de l'écran et peut intégrer des textes descriptifs. De plus il permet de créer des liens vers des zones de l'images sans avoir à la mapper.

Le gros problème est qu'aucun navigateur ne supporte évidemment ce format pour l'instant. Seul Adobe propose de télécharger un plug-in.

- **m100, le nouveau Palm**

Il devait être moins cher, c'est le cas aux États-Unis (150\$) mais en France il sera à 1500 F (comme le Palm III). Le nouveautés ? Son capot devient amovible (les nouveaux, disponibles en 4 couleurs, coûtent tout de même 200 F pièce !) et il possède un petit hublot qui permet de voir l'heure même capot fermé. Il est plus petit que la série III, faisant perdre à l'écran 1/4 de sa surface et une nouvelle touche permet d'accéder directement au bloc-note. La synchronisation avec l'ordinateur se fait maintenant directement par câble plutôt qu'avec une station d'accueil. Il fonctionne sous Palm OS 3.5 et emporte 2 petits Mo de mémoire.

- **Nouvelle folie japonaise**

Après le Tamagoshi dans la poche voici les nouveaux venus. Ce sont de petites créatures virtuelles qui s'occupent de vous livrer vos mails. Vous devez donc vous en occuper comme leurs prédécesseurs mais la lecture de votre courrier dépendra leur bonne volonté. Il paraît que les japonais en sont fous.

[La version Sony de la chose](#)

-

Un rapport de Forrester Research conclue que les standards open-source (NPLN : logiciel dont le code est accessible à tout un chacun, comme c'est le cas de Linux par exemple) domineront l'industrie du logiciel d'ici 4 ans. Il ajoute aussi qu'IBM et Dell devraient tirer leur épingle du jeu tandis que Oracle et Microsoft auront à batailler ferme pour s'en sortir.

-

Ce sont les enfants de moins de 11 ans qui cliquent le plus sur les bannières de pubs et les adolescents qui cliquent le moins (soit dit en passant, et moi jamais).

- **Vite !**

Le ministère de la Justice américain veut "expédier" le passage de l'appel de Micro\$oft devant la Cour Suprême parce que ce procès "a une importance extrême pour [leur] économie nationale" (sic).

- **La Banque de France soutient Napster....**

... malgré elle. En effet, un pirate a squatté la page d'accueil d'une trentaine de sites dont celui de la BNF

Mardi 15 Août 2000

- **Bonne blague**

Les clients Londoniens de Safeway, une chaîne britannique de supermarchés ont eut une jolie surprise. Ceux-ci ont reçu un message leur annonçant une hausse des prix et leur conseillant de faire leurs courses ailleurs. La firme n'a toujours pas pu déterminer où était la faille.

Lundi 14 Août 2000

- **Musique mobile protégée**

Intel et Matsushita ont lancé conjointement un système de protection des contenus numériques pour protéger par exemple la musique. Il n'est sûrement pas compatible avec Napster

- **e-commerce Visa ou rien**

Les vendeurs on-line vont devoir les respecter les règles établies par Visa

concernant l'e-commerce ou aller voir ailleurs...

- **Un de plus chez Linux**

C'est au tour de Linux, après Dell et IBM de faire de Linux un de ses 3 systèmes d'exploitation stratégiques.

- **e-book par Micro\$oft**

Barnes and Nobles, une chaîne de librairies américaines (deuxième librairie en ligne, loin derrière Amazon.com) et MS lancent le plus gros service de vente de livres électroniques.

Micro\$oft en profite pour glisser Reader 1.5, son logiciel gratuit qui optimise l'affichage des e-Books sur un écran d'ordinateur de bureau ou un PDA, offre des options de recherche de mots, de surlignage ou encore de marque-page.

2000 eBook sont déjà disponibles dans ce format sur le site de Barnes and Noble et 150 titres supplémentaires devraient s'ajouter chaque mois. De plus MS propose d'autres applications dont un programme interagissant dans Word qui permet de convertir un document au format livre électronique et une autre firme, Overdrive propose un logiciel permettant de faire la même chose à partir d'un document HTML ou d'un fichier texte.

A suivre, les plaintes des éditeurs en réponse à la création de moteurs d'échange d'e-books qui ne sauraient tarder à apparaître.

- **PSX 2 fin novembre**

La Playstation 2 ne sera disponible en France que le 24 novembre pour un prix d'environ 3000 F

- **Un standard de messagerie instantanées**

L'Internet Engineering Task Force va examiner 3 propositions de technologies pour définir un standard de messagerie instantanée. La proposition d'AOL, jugée peu innovante a déjà été rejetée (CONTQM : c'est bien mais pourvu que la technologie retenue n'appartienne pas à Microsoft non plus mais plutôt à une firme encore indépendante)

- **Apache 2.0 arrive**

D'ici la fin de l'année, la version 2 d'Apache, l'application serveur web la plus utilisée dans le monde, devrait être terminée pour la fin de l'année.

- **Hotmail sous Win2000**

Microsoft a décidé de ne plus faire appel au monde du logiciel libre, soit ; mais Hotmail, son service de messagerie instantanée fonctionne sous Apache et FreeBSD ! MS va donc être obligé de le faire migrer sous Windows 2000. (CONTQM : quelque chose me dit que le service sera moins performant !)

- **Le web parlera**

Le W3C (World Wide Web Consortium) travaille sur le SSML (Speech Synthesis Markup Language), une extension du XML (eXtended Markup Language) qui devrait permettre d'intégrer des instructions de synthèse vocale

aux contenus textuels du Web permettant de faire des sites interrogeables par téléphone.

- **La chine sous Linux**

L'administration chinoise tournera sous Linux. elle affirme vouloir ainsi "briser le monopole de Windows et des technologies étrangères".

- **Windows is back**

La marine américaine avait renoncé à conserver Windows NT sur ses navires parce qu'il avait tendance à planter. Mais cela ne l'empêche pas d'avoir décidé d'installer une version spécifique de Windows 2000 sur ses nouveaux porte-avions.

- **Carnivore suite**

Le ministère de la Justice américain emploiera une université pour conduire une analyse indépendante du système d'espionnage des mails du FBI : Carnivore.

- **Le 64 bits d'AMD**

Le manuel technique du Sledgehammer, le processeur 64 bits d'AMD a été publié cette semaine. Ce processeur devrait être à la fois capable de gérer les programmes prévus pour les processeurs 32 bits (comme le PIII ou l'Athlon) et les programmes pour les processeurs 64 bits (comme l'UltraSparc de Sun, l'Alpha de Compaq ou le futur Itanium d'Intel).

Vendredi 11 Août 2000

- **Record du monde ?**

La femme la plus "téléchargée" du monde serait Danni Ashe. C'est du moins ce qu'essaye d'établir en ce moment le Livre Guinness des Records. Elle revendique 800 millions de téléchargements. Si vous voulez voir de qui il s'agit : <http://www.dannisharddrive.com/> (pour ceux qui ne s'en seraient pas doutés, il est recommandé d'être âgé de plus de 18 ans !)

- **Un soutien pour Napster...**

...et pas des moindres. Celui qui se faisait dernièrement appeler Prince dit sur son site que Napster est "un développement passionnant dans l'histoire de la musique" et en profite pour critiquer violemment le patron de Time Warner.

- **Poussez-les d'un côté, ils reviennent de l'autre.**

AOL cherche à faire figure propre concernant les MP3 en déconnectant un site de recherche de MP3. Cependant, la firme doit encaisser la sortie d'un nouveau logiciel d'échange de fichiers qui permet aux utilisateurs d'AOL messenger d'accéder à un réseau type Napster.

Pour ceux que ça intéresse, il se nomme AIMSTER et vous pouvez le trouver à : <http://www.aimster.com/>

Jeudi 10 Août 2000

- **Please stop...**

Le Pentagone a lancé un appel aux hackers, les suppliant d'arrêter de s'en prendre à ses réseaux... pour des raisons de sécurité.

- **Un Net-piège...**

Chapeau pour les douanes américaines ! 400 internautes qui espéraient pouvoir accéder à une chaîne satellite américaine à des prix défiant toute concurrence sont en fait tombés dans un piège tendu par les douanes.

- **Le trou de Netscape**

Le trou de sécurité des versions de Netscape antérieures à la version 6 a été dénommé BrownOrifice (petite allusion à son cousin dévastateur BackOrifice). Vous pouvez tester son mode de fonctionnement sur ce site qui lui est dédié : <http://www.brumleve.com/BrownOrifice/>. Ne vous inquiétez pas, je vous rappelle que c'est sans risque pour votre système si ce n'est qu'on peut parcourir votre disque, sans pour autant pouvoir modifier quoi que ce soit.

La meilleure façon de se prémunir contre cette défaillance du système : désactiver les applets Java, en attendant le patch sur lequel travaille Netscape.

Mercredi 9 Août 2000

- **Après les MP3 et les fichiers multimédia, les jeux**

Swapoo, www.swapoo.com, est un site qui suit le chemin tracé par Napster mais il concerne les échanges de jeux pour consoles.

- **La chasse aux pirates est ouverte**

C'est la nouvelle occupation de Micro\$oft. La firme fait appel à la délation par le biais d'une hot-line et d'un service e-mail mais elle s'est aussi équipée d'outils de recherche automatique pour localiser sur le web les logiciels piratés ou vendus à prix suspect sur les sites web, ftp et de chat.

Un moteur de recherche scrute 24h sur 24 le web à cet effet. Micro\$oft compte ainsi recueillir des milliers d'adresses par jour. Afin de contacter immédiatement les sites ou FAI hébergeurs.

MS est soutenu par la Business Software Alliance, association d'éditeurs dont Microsoft est le principal promoteur.

Parallèlement, MS a aussi nommé un responsable aux affaires gouvernementales pour pousser l'administration américaine à mettre la pression sur les États pirates (la Russie et la Chine notamment).

Les éditeurs américains estiment perdre 150 milliards de francs par an du fait du piratage.

- **Netscape fait fort !**

Les navigateurs Netscape permettraient de voir le contenu de votre disque dur et ceci grâce à un applet Java présent sur certains sites.

Mardi 8 Août 2000

- **Un pingouin au poignet**

Les chercheurs d'IBM ont installé le Système d'exploitation Linux dans une montre-bracelet pour démontrer que le système pouvait être utilisé même dans les plus petits appareils.

- **Transmeta première version**

Transmeta a lancé la production de ses processeurs Crusoe chez Taiwan Semiconductor Manufacturing et d'autres fondeurs ce qui pourrait être le début d'une longue série...

- **Onetel raccroche**

Après la suspension des accès illimités, Onetel a décidé de limiter la consommation des abonnés qui y ont souscrit. (CONTQM : Mais que croyaient-ils chez Onetel, qu'avec une connexion illimitée les abonnés ne feraient que 20h ?)

- **Multimania se diversifie**

A partir d'Octobre, les membres de Multimania pourront diffuser gratuitement du contenu audio et vidéo sur leur site perso avec les technologie RealNetworks.

- **Cyber-police chinoise**

Début Août, la Chine a lancé sa police internet.

- **CD audio et MP3**

Ça y est, ils arrive en France ! Une société chinoise, A-Max va lancer mi-août le Napa DA V309 distribué par Bataca. Il s'agit d'un discman qui peut lire aussi bien les CD audio que les MP3. Son prix sera de 1300 F environ. (CONTQM : avant de vous ruer dessus, méfiez-vous, j'ai eu l'occasion de tester un modèle concurrent et le résultat n'était pas fameux.)

Dimanche 6 Août 2000

- **Les secrets d'Apple révélés par l'Abeille ouvrière**

Apple a demandé une enquête judiciaire suite aux révélations faites concernant son prochain portable iBook. Un inconnu a en effet publié sur le web des informations concernant sa nouvelle souris optique et un PowerMac biprocesseur avant leur présentation le mois dernier. Worker Bee, c'est son nom, aurait aussi dévoilé un troisième produit que la firme à la pomme n'a toujours pas présenté, qui serait une version de l'iBook équipée d'un processeur plus

rapide. Apple a donc sommé le portail Yahoo! de révéler les informations les informations qu'il possède sur worker bee puisque celui-ci a fait ses révélations sur GeoCities (qui appartient à Yahoo!).

- **Publicité pour l'échange de fichiers**

La décision de fermer Napster a doublé les connexions au site. Le soir de la fermeture du site, le nombre de connexions a été porté à 849196, contre 443070 la veille. Il a ainsi dépassé la fréquentation de sites comme Amazon.com. De plus les sites de téléchargement enregistre une hausse importante des demandes de logiciels d'échange de fichier.

- **Le Limousin n'est pas rentable**

Le Conseil régional dénonce la disparition de la notion de service public. En effet, le Limousin fait partie zones que Completel a jugé non rentables pour l'utilisation la boucle radio locale pour l'Internet.

- **Le mobile tue ?**

Un procès va s'ouvrir aux États-Unis suite à la plainte d'un médecin estimant que sa tumeur cérébrale est due à son téléphone cellulaire. Au Royaume-Uni, le gouvernement s'est lancé dans une campagne pour inciter les enfants à ne pas utiliser les cellulaires. Pendant ce temps des études sont toujours en cours pour déterminer si oui ou non il y a danger.

- **IBM et Micro\$oft pour un standard**

Les deux compagnies ont décidé de collaborer pour définir des standards internet, concernant notamment le XML pour simplifier le développement de leurs applications futures.

- **Dessins animés sur PDA**

Cela pourrait arriver bientôt... Warner Brothers et Sony Pictures sont en train de tester la possibilité de distribuer, par le biais d'Internet, des dessins animés sur ce support.

- **Le Conseil constitutionnel censure**

Le Conseil constitutionnel a apporté des modifications à la loi sur la liberté de communication, notamment en censurant d'office l'article concernant la responsabilité pénale des hébergeurs, déclarant anticonstitutionnelle la saisie par un tiers.

- **La Dram Rambus double sa vitesse**

Une RDRAM 1066 MHz, avec une bande passante de 2,1 Go/s, voilà la dernière avancée du constructeur de mémoire. La technique ? La même que celle de la DDR SDRAM : le doublement de la fréquence (2*533 MHz).

- **Vous jouerez plus tard**

La sortie en Europe de la Playstation 2 a été retardée, vraisemblablement pour pouvoir répondre à la demande en Amérique du Nord.

- **Alerte aux virus**

McAfee a créé un service qui vous envoie les formations sur les nouveaux virus directement sur votre téléphone WAP.

- **Téléchargement de musique autorisés**

Cette semaine Universal lance son service de téléchargement de musique imitant ainsi Sony et EMI. BMG et Time Warner s'y mettront d'ici la fin de l'année

Vendredi 4 Août 2000

- **Opérateurs téléphone : US vs UE**

Près de 50 compagnies de téléphone européennes se sont jointes à la campagne de l'Union Européenne pour stopper la proposition de loi américaine visant à empêcher, entre autres, Deutsche Telekom de s'offrir Voicestream.

- **Micro\$oft a chaud**

L'Union Européenne a officiellement lancé à son tour une procédure antitrust contre Micro\$oft. Du coup, MS incite un juge à renvoyer plus de 60 actions en cours aux États-Unis pour avoir les mains un peu plus libres

Jeudi 3 Août 2000

- **Le GMT ne sera pas la référence**

Tony Blair s'était engagé dans une campagne pour que Greenwich soit le point de référence de l'horloge internet avec le GeT (Greenwich Electronic Time). Mais le système basé sur Java est incompatible avec Internet Explorer, donc avec près de 80% d'internautes, les tests montrant des écarts allant jusqu'à 9s. (Si quelqu'un peut m'expliquer l'intérêt de créer une heure Internet alors qu'il existe déjà une heure de référence, qu'il m'envoie un mail, merci).

- **Offres d'emploi**

Comme tous les ans, le week-end dernier s'est tenu à Las Vegas le DefCon, le congrès de hackers (NPLN : ceux qui forcent les systèmes informatiques protégés). Depuis quelques années, les hackers invitent même officiellement des agents fédéraux aux conférences. En effet, auparavant, ils cherchaient à s'infiltrer incognito et un jeu avait été lancé, "Spot the Fed" qui consistait pour les hacker à démasquer ces agents. Cette année, les fédéraux (un officiel du ministère de la Défense, un membre d'une cellule discrète proche de la C.I.A.) ont même été invités à s'exprimer sous forme de conférences et de tables rondes (nommées "Meet the Fed"). Le dernier jour, "Spot the Fed" a sorti aussi un gros poisson, un agent de la NSA. Leurs interventions ont eu un point commun, la tentative à peine voilée de recruter des hackers pour les services de

renseignement américains.

Par contre, interrogés à ce sujet, ils ont démenti l'existence du réseau d'espionnage Echelon.

- **Ils ne liront pas grand chose**

Selon les analyses d'un chercheur universitaire, le dispositif de surveillance des mails, qui sera mis en place au Royaume-Uni serait techniquement obsolète. Il ne prendrait pas en charge les serveurs de mail étrangers, ni certains petits FAI britanniques, oubliés par le dispositif, les accès internet à haut débit, ni avec le nouveau protocole internet IPv6 (futur standard du web). Un gaspillage de 200 millions de francs.

- **IBM gonfle ses disques**

D'ici deux ans, les disques durs devraient dépasser les 200 Go. Alors que la technologie holographique, lorsqu'elle sera au point, devrait pouvoir permettre d'atteindre 1 Go par cm², IBM propose une technologie intermédiaire basé sur un système de stockage nano-mécanique composé de milliers de micropointes. Il permet de stocker 1,25 Go sur une surface de 3 millimètres carrés comprenant 32 x 32, soit 1024 micropointes qui réagissent à l'électricité et adoptent un état levé (1) ou baissé (0). On devrait donc pouvoir atteindre 500 milliards de bits par pouce carré, soit 5 fois la densité maximale pouvant être atteinte sur support magnétique, celle-ci étant estimée à 100 (les disques les plus récents ont une densité de 12 milliards de bits au pouce carré).

- **Etudes / Sondages**

Sondage Sofres : Seuls 7 % des internautes de l'Hexagone ont acheté en ligne au cours des derniers mois, contre 27 % des Américains ayant accès au net.

- **WebTV Basque**

Ce mois-ci va s'ouvrir TVPI.fr une web T.V. locale privée du Pays proposant 20% de programmes en langue basque.

Mercredi 2 Aout 2000

- **Du nouveau dans l'échange de fichiers**

La startup Autonomous Zone ose ce qu'aucune n'avait fait auparavant, vous payer pour échanger des fichiers ! Le concept est simple : on reprend le système de Napster étendu à tous types de fichiers, avec son moteur de recherche et tout et tout, sauf que quand quelqu'un télécharge un fichier depuis votre ordinateur, vous recevez des Mojos, une monnaie inventée par la startup mais convertible en dollars (1 mojo = 1/1000 cent).

On pourrait donc s'attendre à revoir le même genre de manoeuvre judiciaire que contre Napster, d'autant plus que certains sites pornographiques majeurs comme Penthouse seraient de la partie. Mais les créateurs de la société sont confiants, assurant qu'on ne peut leur demander de supprimer des références illégales puisque leur système, contrairement à Napster, ne mémorise pas l'index des

fichiers. De plus, ils affirment vouloir travailler avec Hollywood sur un système de paiement volontaire nommé PayLars (en référence à Lars Ulrich, batteur de Metallica à l'origine de poursuites contre Napster).

MojoNation, c'est le nom du logiciel, sera déjà disponible en version beta au salon des Hackers, le DefCon. Le logiciel pourrait de plus reprendre le système de Freenet qui sauvegarde les fichiers sur son serveur, les rendant téléchargeables même après la déconnexion du fournisseur. De plus vous aurez un formulaire à remplir, pour pouvoir établir une liste des fournisseurs de fichiers de confiance (le même système de notation que sur les sites de ventes aux enchères). Pour gagner des Mojos, vous pourrez aussi vendre une partie de votre bande passante, de l'espace disque pour servir de serveur ou créer d'autres services payants.

- **Le futur de Napster**

Napster a entamé une série de rencontre avec EMusic qui pourrait aboutir à un partenariat, lequel pourrait affecter la décision de la cour sur l'action en justice en cours.

- **Red Hat a convaincu Ericsson**

Les efforts soutenus de Red Hat pour faire entrer Linux dans les petits appareils non-PC portent enfin leurs fruits puisque la firme vient de signer un accord de partenariat avec Ericsson.

- **Le Net "s'installe" en Iran et Irak**

En Iran, c'est le premier centre rural connecté au web et en Irak, le premier premier cyber-café

Mardi 1^{er} Août 2000

- **URL plus simple**

Suite à une étude montrant que les utilisateurs de téléphone Wap devaient taper 70 touches en moyenne pour entre une adresse, la société Bango a mis au point un système d'URL par chiffres pour simplifier la tâche. Il se nomme le Bango Number et vous permet de taper un numéro (3 chiffres min) en lieu et place de l'adresse. Maintenant, la course est lancée pour acheter les numéros, les plus chers étant bien sur ceux de 3 chiffres.

- **Quand on a de l'argent...**

Micro\$oft compte dépenser 500 millions de \$ pour le marketing et la vente de sa future console de Xbox, le plus gros budget jamais atteint par la firme pour lancer un nouveau produit.

- **Vous êtes espionnés...**

L'info n'est pas nouvelle, mais cette fois, un cabinet d'étude a utilisé un renifleur de paquet pour savoir quelles informations étaient recueillies à notre insu et le résultat est sidérant.

Ce cabinet a téléchargé des données depuis son propre site. En résumé, les serveurs de Real, AOL ou Netzip récupèrent le nom du fichier (exécutable) téléchargé, l'adresse exacte du serveur de provenance, l'adresse IP de l'ordinateur de l'internaute. Le logiciel crée une clé d'identification à partir du nom de la machine lors de l'installation de Windows . Couplé à un cookie, il permet par exemple de créer un historique des fichiers téléchargés. Lisible en hexadécimal et en équivalent ASCII, le fichier ne laisse guère de doute sur les risques de son exploitation.

- **On joue dans le comique**

Le premier patch correctif pour Windows 2000 US est sorti : 83 Mo (version française pour le 10 Août). Après le patch pour office de plus de 100 Mo, les logiciels de MS coûtent plus cher en téléphone qu'à l'achat si on les veut à jour !

- **Du cinéma avec la Playstation**

Sony a lancé le GScube. C'est un outil de développement pour l'industrie cinématographique et la création multimédia.... basé sur la technologie PlayStation 2.

ICANN ET LA GOUVERNANCE D'INTERNET

HANS KLEIN

DOCUMENT DE RÉFLEXION

ICANN ET LA GOUVERNANCE D'INTERNET

HANS KLEIN

LA GOUVERNANCE D'INTERNET

Internet est souvent salué comme un royaume d'anarchie bienveillante, où la communication libre est solidement établie. C'est une « hydre moderne » capable de contourner la réglementation (Froomkin, 1999, p. 129) et un « espace hors contrôle » (Lessig 1999, p. 24). Comme le dit John Perry Barlow, chantre de l'Internet, « Ô gouvernements du monde industriel ... vous n'avez point de souveraineté là où nous nous rassemblons. » (cité in Lessig, 1999, p. 218).

Pour le dire de façon moins pittoresque, Internet met à l'épreuve la *gouvernance*. J'entends par « gouvernance » l'existence d'une quelconque autorité capable de créer pour l'usage d'Internet des règles globalement applicables et renforcées par des sanctions. La gouvernance d'Internet existe sous des formes diverses et partielles (salons de *chat* sur AOL, ou réglementation gouvernementale des ordinateurs à l'intérieur du territoire national), mais, dans l'ensemble, Internet ne possède pas de système cohérent et efficace pour établir et imposer autoritairement des règles. Cela s'explique tant par les caractéristiques de la technologie (qui rendent difficile tout contrôle) que par l'expansion mondiale des communications *via* Internet (qui crée un conflit de juridiction entre les régulateurs gouvernementaux).

Cette dimension « ingouvernable » d'Internet, pourtant, est en train de changer. Dans son livre *Code (1999)*, Lawrence Lessig analyse diverses stratégies visant à éliminer l'anonymat des internautes et à faciliter l'application de lois contraignantes. Exemple récent : à la suite d'un procès concernant la vente aux enchères sur Internet de souvenirs nazis, interdite en France, la société *Yahoo!* fut condamnée à détecter l'origine géographique des utilisateurs pour leur appliquer la législation sur les contenus en vigueur dans leur pays (AFP, 2000). Comme avec d'autres technologies antérieures, plus Internet se répand dans la société, plus on tâche de l'intégrer dans les structures réglementaires existantes.

Le développement le plus significatif de cette tendance à « gouverner Internet est la création d'ICANN (Internet Corporation for Assigned Names and Numbers). Créée en 1998, ICANN est une association privée à but non lucratif, ayant reçu le mandat officiel d'effectuer la coordination technique des ressources fondamentales d'Internet, tout particulièrement les noms de domaine (par exemple monordinateur.org). Bien qu'elle soit implantée en Californie, son autorité s'étend, directement ou indirectement, à tous les utilisateurs d'Internet.

ICANN a le potentiel de changer radicalement la nature d'Internet. En mettant en place tous les mécanismes nécessaires à la création, à la promulgation et au renforcement de la régulation,

ICANN rend possible, pour la première fois, une vraie gouvernance d'Internet. Internet ne sera plus désormais cette Hydre incontrôlable. Or, les mécanismes de gouvernance d'ICANN rendent possibles toutes sortes de régulations. A de nombreuses reprises, ces dernières années, des tentatives de réglementation d'Internet sont apparues, signe d'un intérêt grandissant pour de tels mécanismes (Froomkin, 1997). Selon les points de vue, la création d'une capacité de gouvernance implique la promesse ou la menace d'une maîtrise de la frontière électronique.

Je vais présenter une analyse détaillée d'ICANN, pour rendre compréhensible le rapport mutuel entre technologie, administration et gouvernance, en expliquant comment le système d'adressage d'un réseau d'ordinateurs facilite un système de gouvernance. Pour ce faire, je commencerai par expliquer ce qu'est la gouvernance, le fonctionnement du système des noms de domaines sur Internet (DNS) et la manière dont le DNS permet la gouvernance.

Cette mise au point pourra éclairer la politique des décideurs comme celle des utilisateurs d'Internet. Le fait qu'Internet a un point de contrôle central et qu'ICANN exerce une politique publique globale est loin d'être communément admis. La reconnaissance de ces capacités de gouvernance justifie l'application des critères normatifs de légitimité, de responsabilité et d'équité à l'institution et à son fonctionnement. Notre étude participe d'ailleurs d'un ensemble croissant de travaux qui analysent politiquement ICANN dans la perspective de ses origines historiques (Mueller, 1999; Klein, 2001a), de son statut légal (Froomkin, 2000 ; Klein, 2001c) et de sa conception institutionnelle (Post, 1998).

Elle prend aussi en compte les débats théoriques portant sur le rapport entre systèmes technologiques et contexte social. Des études récentes sur la construction sociale de la technologie ont souligné l'influence des facteurs sociaux sur les modalités du changement technologique (Bijker, 1995 ; Bijker, Hughes, Pinch, 1987; Klein et Kleinman, 2002). De même, des spécialistes de la politique des techniques ont insisté sur le fait que concevoir un système informatique s'apparente à légiférer, dans la mesure où les deux activités engendrent des structures sociales qui contraignent le comportement humain (Lessig, 1999; Kapor, 1990; Klein, 2000). ICANN présente à l'évidence les caractéristiques d'une telle structuration sociale, dans la mesure où le système de noms de domaine (DNS) définit des paramètres importants de gouvernance.

Je considérerai tout d'abord les facteurs technologiques et institutionnels qui ont, jusqu'ici, empêché la régulation d'Internet, puis je discuterai plus largement la notion de gouvernance. Ensuite j'examinerai le système des noms de domaine en tant que hiérarchie technologique et administrative, en identifiant les caractéristiques qui permettent la gouvernance. Suivra une analyse des mécanismes de gouvernance d'Internet, tels que concrétisés par ICANN. Puis, pour illustrer la manière dont les mécanismes de gouvernance fonctionnent en pratique, j'étudierai la politique publique mondiale d'ICANN à travers la façon dont elle a défini les droits de propriété pour les noms de domaine. Enfin je considérerai le problème de légitimité posé par ICANN et je m'interrogerai sur les aires de régulation envisageables pour l'avenir.

LE PROBLÈME DE LA GOUVERNANCE D'INTERNET

Que l'on soit pour ou contre des régulations spécifiques, on reconnaît généralement que la régulation d'Internet s'est toujours avérée difficile. Copier une musique, des logiciels et d'autres formes de propriété intellectuelle devient de plus en plus aisé, et la multiplication des actions en justice à l'encontre de ceux qui violent la propriété ne représente sans doute

qu'une part infime des cas de copies non autorisées (Fryer, 1995). Des tentatives de contrôle des contenus [d'Internet] par des gouvernements nationaux ont buté sur la nature mondiale d'Internet et des conflits interjuridictionnels (Andrews, 1999).

Les barrières à la régulation proviennent en partie des caractéristiques de la technologie. Les communications d'Internet ne passent pas par un canal central mais, au contraire, par plusieurs réseaux indépendants, et les messages eux-mêmes se séparent en espèces de paquets numériques qui suivent divers itinéraires de leur source à leur destination (Cerf et Kahn, 1974). De multiples émetteurs indépendants envoient de multiples paquets indépendants à travers de multiples canaux indépendants : il n'existe donc pas de canal central de communication qui pourrait servir de point de contrôle pour la promulgation et l'application des règles.

La régulation bute également sur des facteurs institutionnels. Internet met à l'épreuve les juridictions établies (Johnson et Post, 1997 ; Perrit, 1997). L'autorité publique relève de l'État, dont la caractéristique de base est d'exercer son contrôle sur un domaine géographiquement défini (Schroeder, 1998). Or la nature « aspatiale » d'Internet met en cause ces fondements géographiques de l'autorité publique (Holitscher, 1999). La discordance entre un réseau mondial et des règles nationales sape bien des tentatives réglementaires (Froomkin, 1997).

Pour comprendre l'essence de cette situation, il est utile de prendre du recul par rapport aux détails et de considérer la gouvernance d'un point de vue théorique. Qu'est-ce que la gouvernance ? Qu'est-ce qui est nécessaire pour gouverner ? Que requiert la gouvernance d'Internet ?

Dans son ouvrage *La démocratie et ses critiques* (1989), Robert Dahl explique ce qu'est la gouvernance et comment l'atteindre. Il identifie une série d'« hypothèses politiques » (p. 106-107) qui précisent les conditions minimales pour un système de gouvernance. Ces conditions, je les appelle les « mécanismes de la gouvernance ». En paraphrasant la définition de Dahl, on peut identifier quatre de ces mécanismes, dont le premier sera *l'autorité*. La gouvernance demande un gouverneur ou un souverain. Une entité - individu ou groupe - doit prendre les décisions politiques qui s'appliquent aux membres de la communauté. Un deuxième mécanisme de gouvernance est *la loi*. Les lois mettent en œuvre des décisions politiques, sous la forme soit d'une taxe, soit d'une autorisation, ou simplement d'une règle qui engage. Troisièmement, il faut un mécanisme pour imposer des *sanctions* qui permettent de punir ceux qui violent les lois. Enfin, la gouvernance exige une définition de la *juridiction*. Celle-ci définit l'espace au sein duquel l'autorité peut appliquer ses décisions et où les lois sont applicables sous peine de sanctions. Ces quatre mécanismes rendent possible la gouvernance : *l'autorité* gouvernante peut prendre une décision politique qui s'appliquera à l'intérieur de sa juridiction, en incorporant cette décision dans des *lois* et en imposant des *sanctions* à tous ceux qui ne s'y conforment pas (cette analyse se retrouve dans l'appendice de *Code* [Lessig, 1999]).

Le caractère ingouvernable et tant vanté d'Internet résulte de l'absence de ces quatre mécanismes. La régulation est difficile parce que l'autorité, la loi, les sanctions et la juridiction ne sont pas assurées.

Or ICANN réalise ces quatre mécanismes à travers son contrôle du système de noms de domaine Internet (DNS). Contrairement aux autres aspects d'Internet, le DNS est centralisé : bien que la communication par Internet soit décentralisée, l'adressage sur Internet est centralisé. Le DNS fournit le point de contrôle à partir duquel il est possible de réguler les utilisateurs. Le DNS est aussi une ressource essentielle, et comme tel fournit un moyen d'appliquer des sanctions aux utilisateurs : le refus d'accès aux noms de domaine est l'équivalent du bannissement d'Internet. En outre, le DNS définit en grande partie les juridictions d'Internet.

L'organisation logique du DNS répartit l'autorité sur des zones distinctes. Les fondements contractuels du DNS permettent de promulguer des règles. Associées les unes aux autres, ces caractéristiques rendent ICANN capable de gouvernance.

Mais pour comprendre ICANN, il faut d'abord comprendre le système des noms de domaines.

LE DNS ET LA GOUVERNANCE : ÉTAT DES LIEUX

Je vais analyser le DNS en deux étapes, le présentant d'abord sous sa forme simplifiée : un système unique et non distribué. Dans cette perspective, les caractéristiques de la gouvernance du DNS sont plus visibles. J'étudierai par la suite la structure interne et distribuée du DNS et présenterai les divers mécanismes utilisés pour assurer la cohérence de l'administration et de la décision politique

Le DNS, point de contrôle d'Internet

Commençons par une réalité méconnue : Internet consiste dans la réunion de deux « systèmes », dont l'un vise la *communication* (les protocoles TCP/IP) et l'autre *l'adressage* (le DNS). Le système de communication est l'aspect le plus connu d'Internet. Il est extrêmement décentralisé - on pourrait même dire qu'il n'est pas un « système » mais plutôt une série de protocoles grâce auxquels des réseaux d'ordinateurs indépendants peuvent s'envoyer des données. C'est lui qui nourrit l'image d'Internet dans le grand public et les prétentions à l'« ingouvernabilité » (Fromkin, 1997).

Le système d'adressage - le DNS - est au contraire centralisé. Presque toutes les communications sur Internet en dépendent. On peut concevoir le DNS comme l'annuaire et les renseignements téléphoniques d'Internet. Avant qu'un ordinateur puisse communiquer avec un autre, il doit composer l'équivalent du « 12 », donner le nom de celui qu'il appelle, puis attendre la composition du numéro. C'est un préalable indispensable à la communication.

Chaque fois qu'un utilisateur clique sur un lien de page web ou envoie un e-mail qui comporte un nom de domaine, le DNS doit *résoudre* ce nom de domaine. Du point de vue de sa structure interne, le DNS consiste en une base de données et un service de recherche dynamique. Les entrées dans la base de données comprennent un identifiant alphanumérique convivial (le *nom de domaine*) et un identifiant numérique pour la machine (le numéro ou adresse *IP*, Internet Protocol). Ainsi, le nom de domaine d'un ordinateur serait *monordinateur.org*, et son numéro IP correspondant *12.34.56.78*. Le DNS reconnaît le nom de domaine et forme le numéro correspondant. Les ordinateurs qui effectuent cette opération s'appellent des *narre servers* (serveurs de noms). Une fois celle-ci effectuée, la correspondance par courrier électronique ou la communication sur le web peuvent s'engager¹.

Ce processus à deux étapes est immédiatement perceptible avec la plupart des navigateurs (comme Netscape). Une fois que l'utilisateur a tapé le nom du domaine, le navigateur indique qu'il est en correspondance avec le DNS avec un message du genre : « Recherche de l'hôte... » Plusieurs secondes peuvent s'écouler avant que la résolution soit effectuée et que la communication entre ordinateurs puisse commencer. Parfois la résolution du nom échoue,

¹ Cette explication simplifie un peu les choses. De fait, si l'on utilise les numéros IP directement, on n'a plus besoin d'interagir avec le DNS pour communiquer *via* Internet. Note au lecteur : selon mon expérience, à toute affirmation concernant le DNS on peut trouver une exception. Merci d'en tenir compte en lisant cette partie de l'article, simplificatrice à l'extrême par souci de clarté.

comme par exemple quand une faute de frappe ou d'orthographe donne un message du genre « Impossible de trouver l'hôte... », et aucun numéro ne répond. En regardant les messages sur l'écran du navigateur, un utilisateur peut observer le processus de résolution du nom.

Au coeur du DNS se situe *l'espace de nommage* d'Internet. Celui-ci fournit une liste de (presque) tous les ordinateurs connectés à Internet². A ce jour, l'espace de nommage contient des dizaines de millions d'entrées. Dans les statistiques sur la croissance d'Internet, les chiffres se réfèrent en général à l'étendue de l'espace de nommage, qui fournit une approximation du nombre d'utilisateurs individuels : puisque la plupart des ordinateurs qui figurent sur la liste du DNS sont des portails d'accès aux réseaux privés connectant un grand nombre d'utilisateurs individuels, le nombre d'utilisateurs est bien plus élevé que celui des entrées dans l'espace de nommage.

En d'autres termes, l'espace de nommage *est* Internet. Pour exister sur Internet, un ordinateur doit figurer sur la liste de l'espace de nommage. A défaut (donc sans nom de domaine et sans numéro IP), un ordinateur ne pourra pas être trouvé par d'autres. Enlever un ordinateur du listing de l'espace de nommage, c'est comme le bannir d'Internet, car l'ordinateur disparaît de la liste des ordinateurs adressables. Quelle que soit l'entité qui contrôle l'espace de nommage, elle contrôle aussi effectivement Internet. On reverra cela en détail plus loin.

Dans sa conception actuelle, l'espace de nommage doit se conformer à certains principes (IAB, 2000; ICANN, 2001). Les concepteurs du système prétendent que l'espace de nommage doit être *unique* et géré par une seule entité. Il ne peut exister qu'une seule base de données qui constitue le listing définitif des ordinateurs sur Internet. Il peut y avoir des copies, mais non pas des espaces de nommage indépendants : si c'était le cas, tout nom de domaine pourrait correspondre à des adresses IP différentes selon l'espace de nommage utilisé, ce qui ôterait toute fiabilité à la communication. Cet impératif technologique du caractère unique sous-tend la centralité du DNS, car toute communication utilise un espace de nommage unique et obligatoire. Le recours, sur Internet, à un espace de nommage unique (avec un administrateur unique) « ... est une nécessité technique, et non un choix politique » (IAB, 2000). (Si cette caractéristique n'était pas impérative, l'éventail des choix politiques serait largement ouvert.)

L'administration

Le DNS est plus qu'un système technique : c'est aussi un système administratif et politique. Poursuivant notre présentation simplifiée du DNS comme base de données unique et non distribuée, on peut l'examiner sous l'angle de l'administrateur unique et de l'autorité politique exclusive. L'entité *d'autorité politique* formule des règles générales pour tout changement apporté à l'espace de nommage, décidant, par exemple, des noms de domaine admissibles, du coût d'enregistrement dans l'espace de nommage et des restrictions sur l'ajout ou la suppression de noms. *L'administrateur* met en oeuvre ces décisions, en ajoutant, supprimant, ou modifiant les entrées dans la base de données pour refléter l'entrée, la sortie ou le changement de statut de divers ordinateurs. L'administrateur garantit également la fiabilité du serveur de noms.

² C'est peut-être trop dire. Certains ordinateurs figurent sur la liste plusieurs fois. D'autres n'y figurent peut-être pas du tout et ne peuvent être contactés qu'en tapant l'adresse IP directement. Dans la majorité des cas, pourtant, un ordinateur sur Internet = une entrée dans *l'espace de nommage* du DNS. Or, comme on le verra plus loin, la plupart des ordinateurs présents dans le DNS ne sont pas des ordinateurs individuels mais des portails d'accès aux réseaux privés au sein desquels existent des comptes d'utilisateurs individuels.

L'obligation du caractère unique du DNS implique que l'autorité politique et l'administrateur exercent un pouvoir de type monopolistique. Il y a impérativement un espace de nommage unique, géré par un administrateur unique qui, à son tour, est sujet à l'autorité politique unique.

« La conception comme le fonctionnement du protocole du DNS sont puissamment conditionnés par l'existence d'un propriétaire ou administrateur unique... » (IAB,

2000). La fiabilité du fonctionnement de l'espace de nommage est à ce prix. Directement ou indirectement, cet administrateur unique du DNS passe un contrat avec tout réseau connecté à Internet. Ainsi, la centralisation administrative et politique va de pair avec la centralisation technique du DNS.

L'administrateur du DNS s'appelle aussi un *registry*. Pour qu'un ordinateur soit disponible sur Internet, l'utilisateur doit demander à l'administrateur d'être *enregistré*. Le registry enregistre l'ordinateur en ajoutant le couple nom-numéro de l'utilisateur à l'espace de nommage.

Le mécanisme légal qui relie l'autorité politique centrale aux utilisateurs est *un contrat*. Internet est un réseau de réseaux : la plupart des ordinateurs enregistrés dans l'espace de nommage sont en fait des portails d'accès à des réseaux privés, gérés à leur tour par des administrateurs de réseau. Chaque entrée dans le DNS s'accompagne d'un contrat entre l'administrateur central du DNS et un *administrateur de réseau*. Ce contrat précise les règles et conditions pour l'inclusion dans l'espace de nommage, c'est-à-dire la fourniture des coordonnées de contact, le règlement d'une cotisation annuelle, la reconnaissance du rôle de l'administrateur du DNS, etc.. Ainsi, tout réseau d'Internet passe un contrat avec l'entité unique qui supervise le DNS.

Le DNS et la gouvernance d'Internet

A partir de cette vision simplifiée du DNS, on voit comment la gouvernance est envisageable. Il suffirait de quelques modifications mineures pour mettre en oeuvre les quatre mécanismes de l'autorité, de la loi, des sanctions et de la juridiction.

Le DNS instaure une autorité centrale pour Internet. L'obligation du caractère unique de l'espace de nommage exige une autorité centrale unique dont les décisions s'appliquent à tous les serveurs dans l'espace de nommage. Pour faire de l'autorité politique du DNS une vraie entité régulatrice, il faudrait simplement que son champ de décision s'étende aux enjeux de politique publique, tels que la réglementation de la propriété intellectuelle ou le contrôle du contenu. Puisqu'il y a très peu de barrières techniques à une telle expansion, il s'agirait bien alors d'un choix politique. L'exercice de la gouvernance sur Internet exigerait donc simplement d'élargir la gamme des sujets régulés par l'autorité politique du DNS.

Le DNS définit également le deuxième mécanisme de gouvernance : la loi. La loi d'Internet s'exprime dans les contrats pour l'enregistrement des noms de domaine. Les contrats avec les administrateurs de réseaux détaillent les règles à respecter. Pour réguler de plus vastes questions, il suffirait d'élargir la formulation des contrats.

Troisièmement, le DNS intègre un puissant mécanisme de sanctions : le refus d'un nom de domaine (par exemple, suppression du couple nom-numéro d'un utilisateur du listing de l'espace de nommage). C'est le pouvoir de bannir : les administrateurs de réseaux refusant de se conformer aux règles précisées dans leurs contrats pourraient être éliminés de l'espace de nommage et contraints à la disparition informatique. L'enregistrement des noms est donc conçu comme un privilège, révoquant en cas de transgression.

Le DNS résout tout aussi nettement le problème de la juridiction. La juridiction de l'autorité politique du DNS s'étend à tout ordinateur relié à Internet, mais ne va pas plus loin. C'est le contrat d'enregistrement qui manifeste la juridiction. Tout administrateur de réseau est lié contractuellement à l'autorité politique du DNS.

C'est ainsi que le système de noms de domaines fournit les moyens de la gouvernance. Il suffirait de quelques changements mineurs pour conforter chaque mécanisme. L'autorité politique du DNS n'aurait qu'à élargir son champ de régulation pour inclure des réglementations plus larges dans les contrats signés avec les administrateurs de réseau. Le refus d'un nom de domaine fournit un mécanisme suffisant pour sanctionner ceux qui ne se conforment pas aux règles. Et la juridiction de l'autorité politique s'appliquerait exactement à Internet, ni plus ni moins.

Mais pour assurer plus complètement la gouvernance d'Internet il faut considérer deux problèmes supplémentaires. Le premier est pratique : il faudrait trouver le moyen d'étendre l'autorité politique jusqu'à l'utilisateur individuel. Le contrat d'enregistrement du nom de domaine étant convenu entre l'autorité centrale et un administrateur de réseau, les utilisateurs individuels ne sont pas directement soumis à ces régulations. La régulation des utilisateurs individuels impliquerait un *contrat aval*. Les administrateurs de réseau demandent en général aux utilisateurs de signer un accord lorsqu'ils prennent un compte, et cet accord avec l'utilisateur pourrait reprendre les termes du contrat des administrateurs. Ainsi une seule série de règles irriguerait tous les niveaux, de l'administrateur central du DNS aux administrateurs de réseaux locaux et, dès lors, à tout utilisateur. De façon indirecte, tous les utilisateurs d'Internet se verraient alors régulés par l'administrateur central du DNS. Toute violation du contrat par l'utilisateur pourrait faire interdire d'accès son compte. Et les administrateurs de réseau qui ne réussiraient pas à imposer des contrats « aval » avec leurs utilisateurs se verraient soumis au refus du nom de domaine, c'est-à-dire au bannissement d'Internet. Bien qu'un tel contrat reste aujourd'hui théorique, il est néanmoins tout à fait envisageable. Dans un paragraphe ultérieur, je résumerai les types de régulation qui ont été ou qui pourraient être instaurés au moyen d'un tel système.

Une deuxième considération à propos de la gouvernance est de nature plus normative. Si l'autorité politique du DNS devenait un régulateur à visée générale, il faudrait alors repenser fortement sa *légitimité*. Avec l'extension de sa capacité décisionnelle, son autorité devrait se fonder sur un principe de compétence. Ce serait le cas si l'on plaçait l'autorité politique ultime entre les mains des gouvernements ou d'une institution représentative constituée à cet effet. Comme on le verra plus loin, quand l'autorité politique fut confiée à ICANN, celle-ci adopta un processus représentatif pour assurer sa légitimité.

Jusqu'ici, j'ai développé une hypothèse simplificatrice : l'espace de nommage d'Internet se compose d'une seule base de données centralisée. Au tout début du développement d'Internet, c'était le cas. Dans les années 1970, l'espace de nommage tout entier se trouvait dans un seul fichier appelé « *hosts.txt* » (Froomkin, 2000). A partir de 1983, pourtant, la croissance continue du réseau conduisit les chercheurs à reconceptualiser l'espace de nommage et à le fragmenter en pièces multiples et interconnectées. L'espace de nommage est moins centralisé que je ne l'ai représenté jusqu'ici, et cette décentralisation rend bien plus complexe la gouvernance d'Internet. Je vais maintenant procéder à l'analyse de cette architecture complexe.

LE DNS COMME SYSTÈME DISTRIBUÉ

L'espace de nommage est une base de données *distribuée*. Théoriquement toutes les paires nom-numéro pourraient être incluses dans une seule base de données centrale, comme décrit plus haut. Mais, puisqu'à chaque seconde ont lieu des milliers de requêtes de noms, un ordinateur centralisé en charge du DNS serait facilement débordé. L'espace de nommage est donc distribué entre de multiples ordinateurs pour partager la tâche.

L'espace de nommage consiste en une collection de bases de données partielles, séparées les unes des autres, tournant sur des ordinateurs distincts. Chaque base de données partielle s'appelle un *fichier-zone* (ou

zone »). Une zone comprend un sous-ensemble de la liste générale de paires nom-numéro. A chaque zone est associé un *serveur de noms* (ou « serveur » - un logiciel pour la résolution des noms) et un *ordinateur hôte* (ou « hôte » - le matériel où se logent le dossier de zone et le serveur de noms). Ainsi l'espace de nommage tout entier est un système distribué de bases de données et de résolution de noms dont la pierre angulaire est la triade fichier-zone /logiciel du serveur de noms/ordinateur-hôte.

Comme pour toute base de données distribuée, le rapport entre les membres est soigneusement structuré. Les diverses zones sont *liées* entre elles pour former une hiérarchie pyramidale inversée ou un arbre à l'envers (avec les racines en haut). Au sommet de la hiérarchie se trouve une zone unique, la *racine*. Cette zone-racine est reliée à de multiples zones situées juste en-dessous, reliées à leur tour à de nombreuses autres zones inférieures, etc.. (C'est la même structure qu'on retrouve pour les dossiers d'un ordinateur personnel.) Les strates de la hiérarchie sont faciles à identifier : la zone-racine est liée aux zones « haut niveau », qui sont reliées à leur tour à des zones de « deuxième niveau », viennent ensuite les zones de « troisième niveau », etc..

Bien qu'une zone donnée puisse être reliée vers le bas à de multiples zones, elle ne peut l'être vers le haut qu'à une seule. De façon directe ou indirecte, toutes les zones sont reliées vers le haut à la zone-racine unique. L'existence d'une racine unique dans l'espace de nommage satisfait à l'obligation d'unicité.

Les sous-arbres dans ce système s'appellent des *domaines*. Un domaine est constitué d'une zone et de toutes les zones inférieures. On parle souvent des noms de domaine selon leur niveau dans l'arbre. Ceux qui relèvent des zones de haut niveau s'appellent « domaines de haut niveau » (*top-level domains*, ou TLDs) ; ceux qui relèvent du niveau suivant sont des « domaines de deuxième niveau », etc.. Le domaine de la racine est l'espace de nommage global. L'ensemble du système constitue le « système des noms de domaines » ou DNS. Les termes « zone » et « domaine » sont souvent employés de façon interchangeable, mais la « zone » se réfère à un seul fichier et le « domaine » à ce même fichier et tout autre fichier inférieur à lui dans son sous-arbre.

Un domaine possède un nom - qui, sans surprise, s'appelle un *nom de domaine*. Les noms de domaine de haut niveau les plus connus sont *com*, *.org*, et *net*. Le domaine le plus vaste dans l'espace de nommage, *com*, est relié à des millions de domaines d'échelon inférieur. Une adresse Internet comme *monordinateur.com* associe un domaine de deuxième niveau (*monordinateur*) à un domaine du premier échelon (*.com*). Une série de noms de domaine, où les niveaux sont séparés par des points, identifie de manière précise et unique tout ordinateur dans l'espace de nommage.

Cette hiérarchie distribuée définit les rapports de contrôle de haut en bas. N'importe quel fichier-zone

peut être modifié pour lier (inclure) ou délier (exclure) les zones situées plus bas que lui dans l'espace de nommage. Comme un pouvoir de vie ou de mort virtuelle... Quand un serveur de noms se connecte à la racine à travers une série de liens, il existe dans l'espace de nommage. Si l'on modifie un fichier-zone pour éliminer un lien, le ou les ordinateurs inférieurs à lui dans la hiérarchie seront exclus de l'espace de nommage. Chaque serveur situé dans la hiérarchie contrôle la route jusqu'à la racine pour les serveurs de niveau inférieur.

On peut illustrer ce processus par un exemple. Disons que je voudrais connecter ma société au courrier électronique par Internet. Je possède déjà un réseau interne, et maintenant je cherche à relier mon réseau à Internet. Pour ce faire, il faut d'abord que je connecte un ordinateur-hôte de mon réseau à l'espace de nommage, *i.e.* que j'enregistre le nom de domaine et l'adresse IP de l'hôte dans un fichier-zone du DNS. L'espace de nommage étant une base de données distribuée, il existe plusieurs fichiers-zones auxquels je pourrais me lier : un registry en Virginie gère un fichier-zone qui s'appelle *.com*, un autre en Angleterre en gère un qui s'appelle *.uk*, ma maison-mère en gère un qui s'appelle *.holdingcompany* (qui, à son tour, est relié au fichier-zone *.com*). Quand j'enregistre mon hôte dans un fichier-zone disponible, il est intégré à l'espace de nommage et commence à exister sur Internet. Parallèlement, si mon entrée dans le fichier-zone se trouvait déliée (si le nom de domaine était annulé), mon hôte disparaîtrait d'Internet. La modification du fichier-zone qui une permet d'entrer ou de sortir d'Internet ne dépend pas de moi mais de l'administrateur du fichier-zone immédiatement supérieur au mien, dont je dépends toujours pour être présent sur Internet.

L'administration

Dans une approche simplifiée, j'ai écrit que l'administration et l'autorité politique du DNS reposent sur un couple unique d'organisations. Dans le DNS distribué, *tout* domaine doit avoir une telle paire administrationpolitique (j'en parlerai simplement comme « administrateur » ; dans certains cas, les deux peuvent relever de la même organisation). Ces organisations fonctionnent selon la structure distribuée de l'espace de nommage : l'administration globale du DNS est une hiérarchie multi-organisations, dans laquelle chaque administrateur exerce son contrôle sur les administrateurs des échelons inférieurs. Au sommet se trouve l'administrateur de la racine.

Chaque administrateur exerce un contrôle monopolistique sur son fichier-zone immédiat (qui lui assure l'exclusivité de sa portion de l'espace de nommage). D'ailleurs, tout administrateur exerce son autorité sur l'intégralité du niveau inférieur. Quand il enregistre un hôte de deuxième ou de troisième niveau, il *délègue* de l'autorité à un administrateur de niveau inférieur, qui à son tour exerce le contrôle monopolistique sur ce fichier-zone inférieur. L'autorité tombe en cascade depuis l'administrateur de la zoneracine, responsable pour tout l'espace de nommage, jusqu'aux ordinateurshôtes individuels des zones inférieures. Chaque administrateur est soumis aux politiques des entités supérieures. C'est ainsi que des politiques décidées à la racine peuvent être transmises à toute la hiérarchie pour s'appliquer, directement ou indirectement, à tous les administrateurs du DNS. En tant que groupe, les administrateurs sont les gardiens de l'espace de nommage et donc d'Internet.

Tout comme les fichiers-zone sont entrelacés, les administrateurs sont liés par des contrats. L'administrateur-racine formalise sa délégation d'autorité aux administrateurs inférieurs par un contrat, dont plusieurs articles peuvent devenir obligatoires dans les contrats subséquents. De cette manière, les règles peuvent circuler dans toute la hiérarchie jusqu'à l'administrateur de réseau individuel, ou même à l'utilisateur individuel, comme on l'a déjà vu.

On ne s'étonnera pas de ce que l'administration de la zone-racine soit d'une importance toute

particulière. Tous les autres hôtes sur Internet n'accèdent à l'espace de nommage que par une délégation d'autorité qui provient directement ou indirectement de la racine. L'autorité politique sur la racine - le pouvoir d'ajouter ou de supprimer les domaines de haut niveau - confère un contrôle direct sur tout domaine de haut niveau et un pouvoir indirect sur tout domaine de niveau inférieur. L'exercice de l'autorité sur la zone-racine s'étend à Internet tout entier.

Pour résumer, cette approche plus précise du DNS révèle une complexité technique et administrative de grande ampleur. Considéré dans son ensemble, le DNS est bien un point de contrôle centralisé d'Internet. Et pourtant, puisqu'il est un système décentralisé, le DNS possède une structure -interne qui compte sur le contrôle hiérarchique et les contrats pour rendre effectif son potentiel d'action politique unificatrice.

Les facteurs historiques dit DNS

On peut maintenant passer de l'analyse technique à une analyse historique. Notre propos a jusqu'à présent dessiné le fonctionnement du DNS et de sa structure en tant que base de données distribuée. L'analyse historique mettra en lumière l'évolution de l'espace de nommage du DNS et de sa hiérarchie administrative.

Internet a vu le jour comme projet de recherche dans les années 1970, et les scientifiques du monde de l'informatique qui l'ont développé ont formaté l'évolution de ses institutions administratives et politiques (Hafner et Lyon, 1998). Cette communauté de chercheurs a trouvé son assise dans des institutions comme l'Internet Engineering Task Force (IETF), l'Internet Architecture Board (IAB), l'Institut des sciences informatiques de l'Université de la Californie du Sud (ISI) et l'Internet Society (ISOC) (Leiner *et al.*, 2000).

Une personne en particulier a joué un rôle-clé dans le développement du DNS : le Dr. Jon Postel, informaticien à l'Université de Californie du Sud. Bénéficiant d'une bourse de recherche gouvernementale, Postel a exercé l'autorité politique sur la racine, dans le cadre de l'Internet Assigned Number Authority (IANA). A la tête d'IANA, Postel gérait le fichier-zone de la racine, autorisait l'ajout de nouveaux TLD (domaines de haut niveau), sélectionnait les administrateurs auxquels déléguer l'autorité et il accomplit d'innombrables autres tâches. Postel avait d'abord assumé ce rôle dans les années 1970 en tant qu'étudiant. A proportion de la croissance d'Internet, l'importance des décisions de Postel crût jusqu'aux années 1990, où elles eurent des implications mondiales. Cependant l'autorité politique sur la racine reposait toujours sur sa personne. Et, puisqu'il travaillait sous contrat avec le gouvernement, l'autorité finale demeurait officiellement entre les mains du gouvernement des États-Unis - mais, la plupart du temps dans les années 1980 et 1990 c'est Postel qui a exercé son autorité personnelle sur le DNS.

En 1984, dans un document connu sous le sigle RFC920, Postel, avec son collègue Joyce Reynolds, définit la trajectoire d'évolution de l'espace de nommage (Postel et Reynolds, 1984). RFC920 établit le nombre de zones de haut niveau et leurs noms. Bien que l'espace de nommage se limite à un seul fichier-zone de racine, Postel et Reynolds annoncent en 1984 que l'échelon supérieur consistera en quelque 250 fichiers-zone. RFC920 sert de canevas pour structurer l'espace de nommage et sa croissance future. Le nombre de fichiers-zones ne se fonde sur aucune nécessité technique, il aurait pu être plus grand ou plus petit.

RFC920 précise également les chaînes numériques d'identification des fichiers-zone. Les 250 TLD se divisent en deux classes de nommage : six TLD « génériques » (des « gTLD » : *.gov*, *.edu*, *.com*, *.org*, *.mil*, et *.net*), et 244 TLD codes-pays (des « ccTLD », ayant pour base la liste de référence ISO 3166-1 des codes-pays à deux chiffres, tels *uk* pour le Royaume Uni, *.fr* pour la France, *.jp* pour le Japon, etc.). Encore une fois, les chaînes numériques particulières utilisées dans les noms

de domaine n'ont aucune signification technique ; il suffit qu'elles soient uniques. Elles ont néanmoins une grande incidence politique, car elles donnent forme à des décisions concernant l'utilisation d'Internet. Les 250 TLD définissent un espace de nommage fondé en partie sur des fonctions (.com pour *commercial*, *mil* pour *militaire*, etc.) et en partie sur des identifiants géopolitiques (noms de pays). Décidés bien avant qu'Internet n'acquière une importance mondiale, le nombre de TLD et la signification y attachée vont avoir des conséquences à long terme.

RFC920 définit la structure et les conventions de nommage du DNS et sa mise en Oeuvre s'étale sur plusieurs années. L'instauration des TLD exige la sélection d'un administrateur pour gérer le fichier-zone et le serveur des noms. L'instauration des TLD génériques procède de façon très différente de celle des TLD de codes-pays : les premiers sont sélectionnés par le gouvernement des États-Unis, les seconds choisis par IANA.

Postel et IANA possèdent l'autorité politique sur la racine, mais l'administrateur est une entreprise privée : Network Solutions, Inc. (NSI), qui administre et exerce l'autorité politique sur *com*, *net*, et *org*. NSI prend ses ordres d'IANA, mais travaille en réalité sous contrat avec le gouvernement des États-Unis.

La croissance du domaine *com* procure à NSI richesse et puissance. Lorsque le gouvernement des États-Unis ouvre Internet aux usages commerciaux, en 1994, l'enregistrement en.com explose. A la fin des années 1990, *com* atteint plus de dix millions d'enregistrements - plus de la moitié de tout l'espace de nommage. Cette concentration ne relève pas d'un caractère inné du DNS, mais provient d'un développement inattendu - la combinaison du bon marketing de NSI et de la large acceptation de la convention de nommage du DNS, qui identifie *com* comme LE domaine commercial. Au bout du compte, le domaine *com* représente une telle proportion de l'espace de nommage total qu'il rivalise d'importance avec la racine pour l'ensemble du réseau (Mueller, 1999). Des frais annuels de \$35 USD par nom de domaine enregistré permettent à NSI d'amasser des centaines de millions de dollars de revenus du fait de son monopole sur le seul domaine commercial d'Internet.

En revanche, les administrateurs de TLD de codes-pays sont majoritairement, tout comme IANA, des sociétés sans but lucratif, souvent affiliées aux centres de recherches universitaires. Parce qu'IANA a défini les fichiers-zone en termes de codes-pays et créé un seul fichier-zone par pays, il n'y a qu'un seul administrateur par pays. Chacun d'eux constitue un monopole national implicite : le registre *.fr* est le seul pour la France, de même *uk* pour le Royaume-Uni, etc. Même s'il n'y a aucune base technique pour les monopoles nationaux, la convention de nommage de RFC920 génère un tel système. En termes d'organisation, le système des monopoles nationaux ccTLD rappelle celui des sociétés nationales de téléphone (les PTT), qui opéraient en tant que monopoles nationaux dans la plupart des pays.

En octobre 2000, l'espace de nommage global compte plus de 30 millions de paires nom-numéro (NetNames, 2000). Vu qu'IANA n'a pas étendu le nombre de domaines de haut niveau depuis la sortie de RFC920, ce sont les domaines de deuxième niveau qui ont connu la plus forte croissance. La majorité relève du TLD, *.com*, où NSI a enregistré plus de 18 millions d'hôtes. Les TLD en *.org* et de *.net*, également gérés par NSI, abritent 5 millions d'hôtes supplémentaires. Le reste de l'espace de nommage se distribue pour l'essentiel en divers TLD de codes-pays. A la tête d'IANA, Jon Postel supervise la délégation d'autorité aux nouveaux administrateurs.

Le DNS de la fin des années 1990 est encore bien plus complexe que le système décrit ici. D'abord, il est décentralisé. En 1983 le DNS a été créé comme une base de données distribuée (Mockapetris, 1983). Puis, au fil des ans, de nombreux développements non techniques ont formaté le système. La majorité des TLD portent des identificateurs de codes-pays, qui les

associent aux gouvernements nationaux. Un fichier-zone dans la hiérarchie *.com*, contient presque tout l'espace de nommage (battant ainsi en brèche la décentralisation). Dans une communauté de petits administrateurs à but non lucratif, Network Solutions commence à émerger comme un géant du commerce. Et surtout, l'autorité politique sur l'ensemble du DNS est concentrée sur une seule personne, Jon Postel. La complexité du DNS est lourde de conflits potentiels.

DNS et gouvernance

Cependant le DNS peut toujours permettre d'exercer les mécanismes de la gouvernance. Bien que des accords plus complexes que ceux qu'on a mentionnés soient nécessaires, un DNS décentralisé rend possibles l'autorité, la loi, les sanctions, et les juridictions. Dans cette section, je discuterai de quelle manière la technologie du DNS rend théoriquement possible la gouvernance.

La décentralisation n'a pas d'effet majeur sur la mise en oeuvre de deux mécanismes : la loi et les sanctions. Même si elle engendre de multiples niveaux hiérarchiques, les contrats-aval acheminent néanmoins les règles jusqu'aux utilisateurs. La décentralisation exige une succession de contrats en cascade, mais elle ne remet pas en cause ce mécanisme. De même, le refus (d'accès) à un nom de domaine est une sanction efficace. Si tout administrateur dans l'espace de nommage, de la racine à l'étage le plus bas, exerce un contrôle monopolistique sur son fichier-zone, chacun peut déconnecter des hôtes de niveau inférieur. Ainsi l'enregistrement d'un nom reste un privilège, révocable si l'enregistreur viole les règles.

Au contraire, la décentralisation entrave l'exercice des deux autres mécanismes de gouvernance. Elle fragmente l'autorité politique et la juridiction, surtout dans les domaines de codes-pays. Celles-ci restent unifiées à la racine : IANA peut réglementer tout l'espace de nommage et promulguer les règles à travers toute la hiérarchie. Mais dans les domaines de haut niveau (TLD), le risque existe d'une contradiction avec un autre échelon d'autorité. La distinction entre les TLD génériques (gTLD) et ceux des codes-pays (ccTLD) peut affaiblir l'unité d'autorité et de juridiction.

Les ccTLD sont associés aux pays, et par conséquent à l'autorité politique des gouvernements nationaux. Ceux-ci peuvent prétendre à exercer leur juridiction sur les ccTLD correspondants. Même si les domaines des gouvernements nationaux représentent un niveau inférieur à IANA dans la hiérarchie du DNS, IANA n'est pas en situation de revendiquer sur eux une quelconque autorité. L'institution de gouvernance d'Internet serait bien en peine de remettre en question le droit d'un gouvernement national à décider de sa politique publique. Même si les gouvernements ignorent le DNS (dans la majorité des cas), l'exercice proactif de l'autorité politique par IANA peut provoquer une réaction de leur part. Aussi est-il difficile pour l'autorité politique sur la racine d'affirmer son pouvoir sur les ccTLD.

Autre source de complexité : la pléthore d'autorités au sein des ccTLD. Les TLD de codes-pays sont indépendants les uns des autres, et chacun peut décider de ses propres politiques dans son domaine, source de possibles divergences, voire de contradictions. La décentralisation du DNS a créé des centaines d'autorités, dont chacune peut implicitement prétendre à la juridiction sur son ccTLD. La gouvernance intégrée d'Internet apparaît donc impossible. La décision des ingénieurs informatiques d'organiser l'espace de nommage d'après les grandes lignes politiques dont témoigne RFC920 a fragmenté l'autorité et la juridiction.

Une gouvernance intégrée paraît possible, au contraire, dans les gTLD. IANA peut réguler les domaines tels que *.com*, *.org*, et *.net*, car ceux-ci ne sont pas redevables vis-à-vis d'autorités

extérieures au DNS. Quelle que soit l'autorité dont ils disposent, ils ne la détiennent que par délégation d'IANA. Or, les gTLD ont beau n'être qu'un sous-ensemble du total des domaines, ils se taillent néanmoins la part du lion en nombre d'utilisateurs. L'autorité effective dans ces domaines s'étend de fait à la majorité des internautes.

Le DNS ne permet pas une gouvernance pleine et entière, mais autorise un certain degré de gouvernance. L'exercice d'une autorité et d'une juridiction uniques dans les domaines en *.com*, *.org* et *.net* est aisé. D'ailleurs, vue la grande concentration d'enregistrements dans les gTLD, cette juridiction concerne également la plus grande part des utilisateurs. L'autorité politique de la racine peut les réguler *via* les contrats-aval assortis de la menace du refus d'accès au nom de domaine. La fragmentation de l'autorité demeure, mais elle est limitée.

Pour la limiter davantage, IANA, tout comme les gouvernements nationaux cherchent à coordonner les diverses politiques. Bien qu'il y ait des centaines de ccTLD, les enregistrements ne sont pas également répartis. Des domaines tels que *.jp* ou *.uk* comptent beaucoup plus d'enregistrements que d'autres, par exemple *.bg* (la Bulgarie). La coordination des ccTLD les plus importants avec IANA suffit à unifier les politiques, pour s'approcher d'une gouvernance intégrée.

Enfin, l'on peut revendiquer d'autant plus de cohésion politique que l'on a la possibilité de mettre la pression sur des ccTLD récalcitrants. Si un petit ccTLD hésite à appliquer quelque politique soutenue par IANA et par les grands gouvernements, son autorité peut être remise en cause. IANA peut exercer sa capacité de déconnecter un domaine de haut niveau ou de le réaffecter vers un administrateur plus conciliant. Ainsi les plus petits ccTLD peuvent se laisser persuader (ou intimider) d'adopter les politiques agréées par les plus grands. La cohésion politique générale ne peut qu'y gagner.

Avant de clore ce chapitre, il faut encore considérer le rôle du gouvernement des États-Unis. Ce dernier, grâce à Jon Postel et Network Solutions, revendique l'autorité finale sur le fichier-zone racine. IANA, autorité politique supérieure aux États-Unis, fonctionne sous l'autorité politique des États-Unis. Instaurer les quatre mécanismes de gouvernance, en l'absence d'un changement de statut des États-Unis, serait en quelque sorte permettre à ce pays d'exercer l'autorité ultime sur Internet. Nouvelle cause de tensions avec les autres gouvernements nationaux qui se trouveraient subordonnés aux États-Unis.

Pour résumer, un DNS décentralisé ne peut permettre la réalisation pleine et entière des mécanismes de gouvernance. La loi et les sanctions peuvent s'appliquer, mais l'autorité et la juridiction sont fragmentées. La majorité des utilisateurs se situant dans des domaines génériques (les gTLD) peuvent être régulés par IANA. Mais soumettre l'espace de nommage tout entier à l'autorité d'IANA exigerait des négociations avec un nombre considérable d'autorités nationales autonomes.

D'IANA à ICANN

Ayant passé le DNS en revue, on peut se tourner désormais vers l'Internet Corporation for Assigned Names and Numbers (ICANN). Créée en 1998, et quoique non stabilisée à ce jour, ICANN met en oeuvre le potentiel de gouvernance du DNS, en se servant de l'adressage sur Internet comme d'un levier pour accomplir la gouvernance globale. ICANN n'a pas seulement créé des capacités de régulation, elle les a aussi utilisées : en 1999, elle a promulgué une décision de politique publique mondiale qui définit les droits de propriété intellectuelle sur les noms

de domaine. Je vais ici identifier les caractéristiques spécifiques d'ICANN aux moyens desquelles elle met en pratique l'autorité, la juridiction, la loi et les sanctions.

Commençons par planter le décor historique. A la fin des années 1990, le DNS est contesté de diverses parts. Internet a rapidement débordé ses institutions d'origine, notamment la « personnalisation » d'IANA, dont la légitimité se fondait sur la réputation d'un seul homme. Si quelque malheur arrivait à Jon Postel, IANA serait complètement déstabilisée. Une autre source de tension provient des entreprises qui, au nom de la concurrence, veulent ébranler le monopole de NSI : elles commencent à proposer d'autres espaces de nommage, d'autres TLD (par exemple *zoeb*), et des « registries » indépendants (Mueller, 1998). Ce qui fait peser de nouvelles menaces de fragmentation sur l'espace de nommage. La nature globale d'IANA pose un autre problème. L'Union internationale des télécommunications (ITU) de l'Organisation des Nations unies s'en mêle et cherche à revendiquer l'autorité sur l'espace de nommage. Des gouvernements nationaux et la Commission européenne s'y intéressent eux aussi, estimant que le contrôle exercé par les Etats-Unis sur cette nouvelle infrastructure informatique mondiale menace leur souveraineté. Des controverses naissent sur les questions de souveraineté et de juridiction. Des conflits sérieux émergent autour des noms de domaines correspondant aux marques déposées (par exemple, *coca-cola. conr*). L'organisation mondiale de la propriété intellectuelle (WIPO) de l'ONU, ainsi que des lobbies nord-américains font pression pour faire respecter le droit des marques déposées dans l'univers des noms de domaine (Shaw, 1997). Ce mélange politique est d'autant plus détonnant que les conflits se développent au rythme d'Internet ; chaque mois qui passe témoigne de la croissance exponentielle du réseau et de ses enjeux politiques.

Le processus par lequel la communauté des chercheurs, les titulaires de marques déposées, les entreprises de communication et les gouvernements nationaux se sont concertés pour créer une nouvelle institution à la place d'IANA a été décrit ailleurs (Mueller, 1999 ; Klein, 2001a). Je concentrerai mon attention sur le fruit de ce processus long et litigieux, c'est-à-dire ICANN, en l'analysant sous sa configuration de l'an 2000.

On comprend mieux ICANN si on la perçoit comme un ensemble d'institutions semi-autonomes. Cet ensemble comprend non seulement ICANN en tant que société mais aussi certaines entités externes, telles que le comité des gouvernements nationaux (GAC) et les administrateurs des TLD. Pour bien distinguer entre ICANN vue comme un ensemble d'institutions et ICANN vue comme entité institutionnelle, j'appellerai celle-là « le système ICANN » et celle-ci simplement « ICANN ».

Les quatre mécanismes de gouvernance sont si profondément enracinés dans le système administratif d'ICANN qu'il est difficile de les identifier. Le paragraphe qui suit va analyser les caractéristiques d'ICANN dans leurs fonctionnalités relatives à la gouvernance. Je m'intéresserai tout d'abord à la façon dont ICANN a mis en oeuvre les mécanismes d'autorité et de juridiction, puis je me concentrerai sur les mécanismes de la politique et des sanctions.

L'autorité et la juridiction

L'autorité politique sur la racine est transférée de Jon Postel à la nouvelle instance. ICANN résout le problème de la stabilité : une personne est remplacée par une institution, ICANN peut fonctionner indépendamment d'un seul individu. ICANN résout aussi, au moins en partie, le problème du conflit intergouvernemental : en tant que société privée, elle stipule dans son règlement intérieur qu'aucun fonctionnaire ne peut être membre de son conseil d'administration. Ainsi, même si son autorité s'étend au monde entier, la nature de celle-ci est délibérément non gouvernementale et respecte ainsi la souveraineté des gouvernements

nationaux. En outre, son rôle étant simplement d'assurer la coordination technique de l'Internet, ICANN ne revendique aucune mission de politique publique.

La composition du comité directeur soulève un problème de légitimité. Certes une personne, Postel, est remplacée par un conseil représentatif ; mais la légitimité issue de l'expertise et de la réputation personnelles est remplacée par la légitimité et la responsabilité reconnues aux représentants. Le comité directeur d'ICANN représente divers collèges sur une base fonctionnelle et géographique. Sur les dix-neuf directeurs, neuf représentent des groupements d'experts techniques, neuf autres les utilisateurs, le dernier n'est autre que le « patron » de l'organisation.

Le conseil d'ICANN est cependant soumis à une autorité supérieure : le gouvernement des États-Unis, dont le Département du Commerce (DoC) garde le contrôle de la racine, conservant ainsi un droit de veto sur les décisions politiques d'ICANN. En dépit de la privatisation d'Internet (qui fit grand bruit), les États-Unis n'ont jamais entièrement lâché prise. Comme l'expliquait un document officiel du DoC, « *le département du commerce n'a pas l'intention de transférer à quelqu'entité que ce soit son autorité politique sur le serveur-racine* » (DOC, 1999). Ainsi Internet n'est internationalisé et privatisé que sous la houlette du gouvernement des États-Unis.

En-dessous de la racine, les contrats étendent l'autorité d'ICANN et des États-Unis jusqu'aux administrateurs des gTLD et des ccTLD. Les TLD génériques s'intègrent plus aisément à l'organisation, puisqu'ils sont presque tous administrés par NSI et que cette entreprise subit la pression des États-Unis pour participer à ICANN. Après quelques négociations sur les modalités, NSI et ICANN se mettent d'accord en 1999. ICANN assure ainsi son autorité politique sur les domaines les plus peuplés. Les ccTLD sont plus circonspects, et jusqu'en 2001 ICANN a peu progressé dans ce domaine (ICANN, 2001). L'autorité politique hiérarchique ne s'y est pas établie, ce qui perpétue l'instabilité pour l'ensemble du système.

Le conflit d'autorité implicite entre ICANN et les gouvernements nationaux se manifeste dans le Governmental Advisory Committee (GAC). Le GAC est un comité officiel consultatif; des gouvernements nationaux peuvent s'y rencontrer, débattre et coordonner leurs actions. Individuellement, chaque gouvernement national peut affirmer son autorité politique sur les fichiers-zone qui portent son code-pays. Les gouvernements nationaux peuvent aussi coordonner une politique décidée collectivement au sein du GAC.

Le GAC entend légitimer les prétentions de ses membres à exercer l'autorité politique. D'emblée il affirme que « *le système de nommage d'Internet est une ressource publique en ce sens que ses fonctions doivent être administrées en vue de l'intérêt général ou partagé* » (GAC, 2000). En précisant que le DNS doit être un bien public, tout comme le spectre électromagnétique, le GAC ouvre la voie au contrôle gouvernemental. Ensuite le GAC associe cet intérêt commun à l'autorité des gouvernements nationaux : « *l'autorité politique publique ultime sur le [domaine code-pays] demeure du ressort du gouvernement...* » (GAC, 2000). Ceci justifie la prétention des autorités nationales à exercer la juridiction sur les ccTLD.

ICANN prétendait que l'autorité des ccTLD dérivait de son autorité supérieure sur la racine. Si les administrateurs ne suivent pas les décisions politiques d'ICANN, celle-ci peut redéléguer l'autorité à une autre partie. Les gouvernements nationaux, affirmant que leur fichier-zone est une ressource publique, cherchèrent à placer les ccTLD sous leur propre autorité. Les administrateurs des ccTLD se trouvaient donc soumis à deux autorités - et ils en proposèrent une troisième, de leur cru, citant des documents officiels qui situent l'autorité dans « la communauté Internet locale » plutôt que dans ICANN ou les gouvernements (Postel, 1994). Cette perspective les rendait responsables vis-à-vis des utilisateurs d'Internet dans leurs pays

respectifs, et non vis-à-vis de leurs gouvernements ou d'ICANN.

Les membres du GAC cherchèrent à résoudre cette ambiguïté à leur profit en demandant à ICANN un pouvoir de veto sur les ccTLD identique à celui du gouvernement des États-Unis sur la racine. Le GAC proposa de transférer le pouvoir de redélégation d'ICANN aux gouvernements nationaux : « *quand ICANN sera avertie par le gouvernement ou l'autorité publique concernée qu'un [administrateur] a enfreint les termes du contrat... elle devra réagir en urgence pour réaffecter la délégation...* » (GAC, 2000). Les gestionnaires des codes-pays n'auraient donc eu accès à la racine qu'autant que leurs gouvernements le leur permettaient. ICANN refusa cette proposition, qui la subordonnait aux gouvernements nationaux. Au moment où cet article est rédigé, la fragmentation de l'autorité sur les ccTLD reste un problème non résolu.

Les débats du GAC eurent pour effet que la coordination des gouvernements nationaux s'applique à une large gamme de décisions politiques. Le GAC a entamé la rédaction d'un document de « bonnes pratiques » pour les gestionnaires de codes-pays, afin que les autorités nationales puissent standardiser leurs opérations (GAC, 2000). Une fois définies les politiques communes, tout gouvernement national peut promulguer et imposer ces pratiques dans sa propre juridiction.

Au sein d'ICANN, les mécanismes de l'autorité et de la juridiction reposent donc sur la conception même d'ICANN, sur le GAC et sur la pérennisation du rôle des États-Unis. La gouvernance effective d'Internet est envisageable dans les domaines où les membres d'ICANN et du GAC peuvent se mettre d'accord. En dépit de la fragmentation de l'autorité, la majorité des utilisateurs d'Internet, situés dans les gTLD, sont soumis à celle d'ICANN dans une juridiction unifiée.

La politique et les sanctions

Ayant examiné l'autorité et la juridiction, j'aborderai maintenant la question de la loi et des sanctions. Les premières régulations d'ICANN s'appliquèrent aux domaines en *com*, *org* et *net* de l'espace de nommage, ces derniers étant combinés dans un seul système partagé (*Shared Registry System*, *SRS*). Au moment où j'écris cet article, l'extension des régulations d'ICANN sur les domaines des codes-pays n'est pas encore effective.

ICANN régule les utilisateurs, mais n'est pas directement en contact avec eux. Le SRS définit plutôt un système à quatre étages : ICANN au sommet, les utilisateurs à la base et deux sortes d'organisations intermédiaires : les « registries » et les « registrars ». Au sommet, ICANN utilise son autorité pour créer des régulations. En dessous, les registries gèrent les fichiers-zones et font fonctionner les serveurs (comme décrit plus haut). Encore en-dessous, les registrars font l'interface avec les utilisateurs clients. Ce sont des détaillants en noms de domaines, chargés aussi du service après-vente et souvent de services annexes, comme la fourniture d'accès à Internet. Enfin, à l'étage inférieur se trouvent les administrateurs de réseaux. (Bien entendu, la plupart des utilisateurs d'Internet ne possèdent pas leur propre nom de domaine, mais utilisent celui d'une tierce partie, comme *aol.com*, et constituent ainsi un cinquième niveau de la hiérarchie.)

Une cascade de contrats dévale tous les étages. Les régulations d'ICANN sont contenues dans les contrats avec les registries, puis transmises dans leurs contrats avec les registrars, qui à leur tour les insèrent dans leurs contrats avec les administrateurs de réseaux. Les décisions politiques circulent ainsi de haut en bas, d'ICANN aux registries jusqu'aux réseaux privés. Les termes du contrat définissent les lois d'Internet.

A chaque niveau, le contrat avec ICANN est garanti par la menace d'un refus d'accès au nom de domaine. Tout registry qui ne s'y conforme pas peut voir son domaine redélégué. De même pour les registrars, qui peuvent être privés d'accès aux registries et donc de leur capacité d'offrir les noms de domaine aux utilisateurs. Quant aux utilisateurs récalcitrants, ils risquent de voir leurs noms de domaine supprimés à l'intérieur de l'espace de nommage, ou même affectés à quelqu'un d'autre.

Le contrat ICANN d'accréditation de registrar (ICANN, 1999a) est le mécanisme primaire de promulgation de la loi. Toute organisation qui veut devenir registrar doit se conformer aux termes de ce contrat, y compris à la clause suivante, pourtant très vague : « *le registrar se conformera... à toute politique adoptée par ICANN...* » (Section II.D.1.b.i)³. Comme les politiques d'ICANN changent et que l'accord d'accréditation évolue (comme prévu dans la Section 11.0, « Le droit de remplacer un accord après sa mise à jour »), ainsi en est-il des conditions imposées à l'utilisation de tout nom de domaine. C'est ce « chèque en blanc » contractuel qui, d'évidence, accorde à ICANN le droit d'exercer la gouvernance sur un champ très large. Les termes du contrat sont répétés aux niveaux inférieurs entre les registrars et les utilisateurs ; la circulation fluide des régulations est ainsi assurée, d'ICANN aux registrars, et éventuellement aux utilisateurs. Au besoin, des sanctions sont explicitement prévues : « *Le locataire [du nom de domaine] reconnaît que son enregistrement du nom [de domaine] est susceptible de suspension, d'annulation, ou de transfert conformément à toute politique adoptée par ICANN... pour la résolution des conflits...* » (Section II.J.7.i).

Les mécanismes fondamentaux de gouvernance sont ici assurés par la circulation des contrats, assortie de la menace de refus du nom de domaine. Le contrat d'accréditation stipule les règles en vigueur sur Internet, que renforce le pouvoir de révocation d'un nom de domaine. Les utilisateurs d'Internet ne peuvent jouir de l'accès à l'espace de nommage que s'ils se conforment aux règles établies par ICANN; sinon, leur nom de domaine peut être suspendu, annulé, ou transféré.

UNE POLITIQUE PUBLIQUE MONDIALE

Mon exposé sur le DNS, la gouvernance et la conception institutionnelle d'ICANN a cherché à décrire et analyser des données objectives. Si l'on accepte la quadruple définition de la gouvernance, et si l'on admet que ces mécanismes sont bien à oeuvre dans ICANN, il n'est pas douteux qu'ICANN est capable d'assumer la gouvernance d'Internet. Jusqu'ici, on a très peu traité d'une double question : est-ce qu'ICANN exerce cette capacité ? ce système de gouvernance est-il légitime ? Le dernier chapitre va aborder ces éléments, beaucoup plus sujets à controverses.

La politique d'ICANN

ICANN possède la capacité de gouverner et l'a déjà exercée. ICANN a institué une politique publique mondiale. Je vais expliquer maintenant ce que signifie « instituer une

³ Ce passage de l'accord (Registrar Accreditation Agreement) est important mais pas particulièrement succinct. Le texte entier de la section D.1.b.i dit : « *D. Les obligations générales du registrar. 1. Pendant la durée de l'accord : b. le registrar se conformera à toute politique adoptée par ICANN et ce qu'elle : i. est relative à l'une ou à plusieurs des questions suivantes: (A) toute question dont la résolution uniforme ou coordonnée s'avère raisonnablement nécessaire pour faciliter l'interopérabilité, la fiabilité technique et/ou le fonctionnement stable de l'Internet ou du DNS, (B) toute politique de registrar nécessaire dans les limites de la raison pour l'implémentation des politiques de consensus relatives aux registries, ou (C) la résolution de toute controverse à propos de l'enregistrement des noms de domaine (en tant qu'il contrevient à l'utilisation des noms de domaine en question) ;..*

politique publique », ainsi que la manière dont ICANN s'y est prise.

Aussitôt instaurées dans ICANN, les capacités de gouvernance furent mises en pratique. En août 1999, ICANN promulgua sa première décision politique importante : la Uniform Dispute Resolution Policy (UDRP), procédure visant à déterminer qui possède le droit de propriété sur un nom de domaine (ICANN, 1999b). L'UDRP constitue la première décision de politique publique d'ICANN à visée mondiale.

A la fin des années 1990, les noms de domaine ont pris de la valeur, des noms comme yahoo.com et amazon.com sont devenus des actifs commerciaux d'envergure. De sorte que surgissent des conflits autour du droit des noms quand des individus déposent une marque sur laquelle ils n'ont aucun droit (pour un nom de domaine quelconque), avec l'intention de la revendre à son propriétaire ; quand des titulaires de marques déposées tâchent d'interdire à d'autres utilisateurs l'utilisation d'une chaîne de caractères valorisée. Parfois les droits de propriété entrent en conflit avec les droits d'usage équitable ou la liberté d'expression (Kleiman, 1999). Source du problème : la législation existante ne permet pas de résoudre les conflits puisque la loi des marques est nationale et l'origine du conflit internationale. L'application des législations nationales en vigueur pour résoudre des conflits internationaux sur les noms de domaine coûte très cher et s'avère peu maniable (Littman, 2000).

L'UDRP d'ICANN a défini les procédures de résolution de tels conflits, établissant ainsi des règles de propriété. Selon une procédure alternative, des arbitres certifiés et privés décideront de la question des droits, en utilisant un critère défini par ICANN. Les décisions d'arbitrage seront exécutées par la révocation ou le transfert du nom disputé. C'est un système « amiable » en ce sens que les parties non satisfaites par la décision de l'arbitre peuvent encore recourir aux enceintes juridiques existantes. Mais ces recours étant hors de prix, dans la majorité des cas c'est l'UDRP qui détermine les droits de propriété. Elle prend *de facto* force de loi.

La mise en oeuvre de l'UDRP illustre la manière dont ICANN se sert des quatre mécanismes de gouvernance à la fois. D'abord, l'UDRP a pris forme à travers les suggestions des permanents d'ICANN et l'expression de points de vue divers, et finalement elle a été adoptée par le conseil d'administration d'ICANN dans un exercice d'autorité. Ensuite, la décision politique a pris force de loi dans l'Accord d'accréditation des registrars : ICANN a fait de l'UDRP une condition de leur accès à l'espace de nommage, et ils se trouvent dans l'obligation de l'inclure dans leurs contrats de détaillants (il faut qu'elle circule de haut en bas »). Troisièmement, l'UDRP est assortie de sanctions tout utilisateur refusant d'y souscrire peut se voir refuser l'accès à l'espace de nommage et toute violation peut entraîner la suppression ou la réaffectation du nom de domaine de l'utilisateur. Enfin, l'UDRP s'applique à la juridiction d'ICANN. Elle régule les noms de domaine pour les *com*, *.net*, et *org*. Pour les domaines de codes-pays, où l'autorité d'ICANN ne s'applique pas directement, c'est aux administrateurs des codes-pays de décider d'adopter ou non l'UDRP. A ce jour c'est le cas dans certains domaines, mais non partout.

En instituant l'UDRP, ICANN a institué une politique publique mondiale. L'UDRP régleme un sujet d'intérêt général: les droits de propriété. Les règles concernant les marques déposées, le copyright, la propriété intellectuelle, sont traditionnellement établies par les gouvernements. La Constitution des Etats-Unis, par exemple, précise les règles de protection de la propriété intellectuelle sur les brevets. Au niveau mondial, le manque de régulation s'explique non pas parce que les règles de la propriété sont d'un moindre intérêt public, mais parce qu'aucune institution publique reconnue n'a établi de telles règles. ICANN a souhaité pallier ce manque. En instituant des règles mondiales sur la propriété, ICANN a pris une décision qui concerne aussi les valeurs publiques. L'UDRP n'aura peut-être pas une énorme incidence politique, parce que les droits de propriété sur les noms de domaine concernent un champ de régulation assez

limité, mais elle représente un premier pas vers la prise de décision proprement politiques⁴.

La légitimité

Si ICANN instaure une politique publique mondiale, il faut lui appliquer des critères politiques comme la légitimité, la responsabilité et l'équité. Et c'est autour de telles questions que sont apparues la plupart des controverses (Weinberg, 2000 ; Froomkin, Post, Farber, 1996b ; Klein, 2001c). Je résumerai brièvement certaines des interrogations qui ont surgi autour de la légitimité du Conseil d'ICANN.

La politique suivie par les Etats-Unis pour la création d'ICANN a été explicitée dans le « White Paper » du Département du Commerce. Il définit des principes, dont deux concernent particulièrement la légitimité : ICANN doit s'engager à mettre en place une « coordination privée ascendante » et une « représentation... (qui prenne en compte) la communauté vaste et croissante des utilisateurs d'Internet » (DOC, 1998b). Certains de ces principes ont inspiré le règlement intérieur d'ICANN, surtout en ce qui concerne les mécanismes de la représentation au sein du conseil d'administration (Klein, 2001a).

Dans de nombreuses instances ces principes furent malmenés. J'en mentionnerai trois. Le premier comité directeur d'ICANN était composé de neuf membres, à titre transitoire. Ce premier groupe fut nommé sans la participation ni même la consultation du public - ce qui suscita maintes protestations publiques et auditions devant le congrès des Etats-Unis. La sélection eut lieu à huis clos, processus décrit par Jon Postel lui-même comme « non démocratique et fermé » (Daley, 1998). Ce fut pourtant ce Bureau qui promulgua l'UDRP.

La constitution du conseil d'administration d'ICANN fut tout aussi inégalitaire. Les directeurs représentant les neuf collèges d'experts furent installés en l'espace d'à peu près un an après la création d'ICANN, et ils cherchèrent aussitôt à réduire la représentation des utilisateurs d'Internet. Lors d'une série de réunions en 1999 et 2000, les directeurs nommés, tous des experts, cherchèrent à éliminer, réduire, ou différer l'installation de directeurs élus (ICANN, 2000). A cette fin, ils révisèrent sans arrêt le règlement intérieur qui contraignait les actions du conseil. Comme le déclara un haut fonctionnaire lors d'une réunion tenue en juillet 2000, « *le conseil donne de plus en plus l'impression d'être extrêmement cavalier en ce qui concerne les modifications du règlement intérieur* » (Wilkinson, 2000). Peu après, le conseil décida de modifier une nouvelle fois le règlement pour retarder le dernier tour des élections de directeurs jusqu'en 2002 - soit quatre ans après la création d'ICANN.

Enfin, ce premier conseil afficha sa nette préférence pour que la représentation des utilisateurs d'Internet soit assurée par les professionnels de l'industrie. Lors du premier tour, partiel, de l'élection des directeurs, presque tous les sièges furent pourvus par des candidats nommés par lui, dont beaucoup de personnalités issues des géants des télécommunications comme France Telecom, Fujitsu, Deutsche Telekom et Verizon (ICANN, 2000). Lors de la réunion d'ICANN de juillet 2000, cette tendance à favoriser l'industrie des télécommunications plutôt que les utilisateurs d'Internet sauta aux yeux d'un officiel australien, qui déclara : « [ICANN] *court le risque de se transformer de facto en association d'industriels* » (Twomey, 2000). La légitimité du Conseil fut encore affaiblie par la tendance de certains groupes d'intérêt à rechercher (et, probablement, à obtenir) une influence disproportionnée sur ses décisions.

⁴ Je ne me demande pas si l'UDRP est de « bonne » ou de « mauvaise » politique publique. La substantialité de la régulation n'est pas en question. L'UDRP a suscité autant de louanges (Cohen, 2000) que de condamnations (Flynn, 2000; Mueller, 2001).

Dans la mesure où ICANN exerce une mission de politique publique, son manque de légitimité est frappant. Bien que les élections de l'an 2000 aient instillé une certaine dose de représentation des utilisateurs dans ICANN, elles ont échoué à instaurer le niveau de représentativité exigé par son règlement initial (Klein, 2001b ; Klein, 2001c).

La politique future

Les institutions ne sont pas des entités statiques : elle grandissent avec le temps et souvent modifient et élargissent leurs domaines d'activité. Tel semble être le cas pour ICANN. En tant qu'entité de gouvernance d'Internet, quelles pourraient être les politiques promulguées par ICANN à l'avenir ? Je me livrerai rapidement à quelques spéculations.

Le domaine d'expansion politique le plus probable est celui de la protection de la propriété intellectuelle. Un accroissement des pouvoirs dans ce domaine, revendiqué dès les débuts d'ICANN, serait cohérent avec ses objectifs initiaux (Fromkin, 1999a). L'UDRP pourrait être élargie jusqu'à donner des droits d'enregistrement spéciaux aux propriétaires de noms célèbres, de marques déposées, de noms géographiques, etc. ICANN deviendrait alors une instance régulatrice mondiale au service de la propriété et du commerce électronique.

Le contrôle de l'espace de nommage pourrait aussi servir de levier pour promouvoir la justice sociale. ICANN et les monopoles ccTLD pourraient collecter des fonds pour financer un service universel permettant de surmonter la division numérique du monde, les pays pauvres payant leur accès à Internet moins cher que les pays riches. Au cours de conversations privées, certains des directeurs d'ICANN issus des pays en voie de développement ont défendu devant moi de telles orientations politiques.

Le potentiel politique d'ICANN pourrait également concerner la régulation des contenus. Des sites contrevenants pourraient être censurés par la révocation ou la réaffectation de leurs noms de domaine. Le premier à être ainsi sanctionné fut le site *voteauction.com*, qui proposait un contenu illégal (un système de vente et d'achat de votes aux enchères en ligne). Le registrar du domaine a annulé l'enregistrement pour supprimer son contenu (Perritt, 2001). En théorie, ICANN pourrait renforcer ses impératifs de régulation en utilisant plus largement de tels mécanismes.

ICANN pourrait aussi devenir un instrument de taxation, permettant à un gouvernement de collecter l'impôt sur le e-commerce, ou dégageant les moyens de financer son propre personnel. Si les noms de domaine étaient accordés via une source unique, les utilisateurs devraient payer les frais correspondants, ou à défaut se verraient refuser l'accès. De fait, des législateurs nord-américains et des ccTLD mécontents ont déjà accusé ICANN de lever des taxes (McCullagh, 1999; Ward, 2000).

Enfin, ICANN pourrait devenir un instrument de la politique nationale des Etats-Unis. En temps de guerre ou de terrorisme, un pays qui s'opposerait aux Etats-Unis pourrait voir disparaître d'Internet ses domaines. Des enregistrements individuels pourraient être annulés ou transférés pour affaiblir des entités hostiles. Le rapport entre la politique d'ICANN et la politique nationale des Etats-Unis s'est déjà manifesté quand le Département du Commerce a approuvé l'ajout du domaine .ps - pour la Palestine - à la zone-racine. Bien que les Etats-Unis n'aient pas été guidés par un intérêt national étroit, l'affaire a fait grand bruit en raison de son potentiel conflictuel (Cisneros, 2001).

Les mécanismes de gouvernance étant mis en place, une « campagne d'infiltration » - l'expansion continue du champ réglementaire d'ICANN - semble possible. La combinaison de mécanismes efficaces de gouvernance et de mécanismes faibles de légitimité pourrait même

conduire à créer des règles en fonction des opportunités.

Conclusion

Admettre tout simplement qu'ICANN est chargée de la gouvernance d'Internet est lourd de significations. C'est contrecarrer des croyances bien établies et susciter des inquiétudes quant au type de gouvernance qui est en train de s'instaurer. Cela nous oblige à nous demander ce qu'il faudrait faire.

ICANN contredit la vulgate de l'anarchie bienveillante d'Internet. En fait, on découvre qu'Internet *peut* être contrôlé. Le DNS fournit la base d'un contrôle descendant, et ICANN l'utilise pour mener une véritable politique. Les implications de cet état de fait sont de plus en plus vastes et ne seront vraiment perçues qu'avec le temps. Pour cette raison, tout utilisateur d'Internet est tenu de s'intéresser à l'avenir d'ICANN.

Je terminerai par quelques observations sur le rapport entre technologie et société. ICANN révèle sous trois facettes la manière dont la technologie modèle la société.

Les traits objectifs de la technologie ont dessiné le système administratif et régulateur. En particulier, les caractéristiques techniques d'une base de données distribuée ont effectivement paramétré la politique. Le besoin d'un espace de nommage unique avec une racine unique a créé un point de contrôle central. De même, le besoin d'identifiants uniques (afin qu'un nom corresponde à un seul ordinateur-hôte) a créé des problèmes de contrôle et de monopole. La définition d'une zone *coin* unique, à l'intérieur de laquelle ne peut être enregistré qu'un seul *.ibm*, a engendré un système de registries monopolistiques et suscité des conflits autour du droit des marques. Peut-être toutes ces caractéristiques n'étaient-elles pas absolument nécessaires (bien qu'aucune alternative crédible n'ait été avancée, même par les plus critiques envers ICANN). On doit pourtant reconnaître que l'histoire les a si bien ancrées dans la conception et le fonctionnement du système qu'elles ont acquis un caractère de quasi-nécessité. Toute tentative de changer le statut régulateur d'ICANN impliquera sans doute de concevoir une nouvelle technologie de base (ceci concerne en particulier l'exigence d'une racine unique sous le contrôle d'un administrateur unique).

La technologie a formaté la société d'une autre manière, qui concerne le rôle des ingénieurs dans l'établissement d'une politique. La sélection des noms de domaine des codes-pays fut une décision historique aux conséquences politiques majeures. Cette décision fut prise si tôt dans le processus du développement d'Internet que les seuls protagonistes furent les ingénieurs de recherche. Ceux-ci ont décidé qu'Internet devait être gouverné par les gouvernements nationaux. S'ils avaient choisi d'autres identifiants alphanumériques - couleurs, séquence de chiffres, table d'éléments -, la répartition « un domaine par pays » des registries ne serait guère fondée, non plus que l'affirmation subséquente de l'autorité nationale sur les registries. Les ingénieurs ont choisi d'organiser Internet sur le modèle des PTT nationales. Ils n'ont pu prendre de telles décisions que parce que celles-ci sont intervenues très tôt dans l'histoire du développement de la technologie, à un moment où eux seuls étaient concernés.

Troisièmement, la technologie influence la société dans la mesure où elle peut légitimer des décisions prises sous le sceau du secret. Quand des décisions politiques sont classifiées « techniques », il ne paraît pas illégitime qu'elles soient prises par des élites, derrière des portes fermées. La politique disparaît alors de la vue publique (Lessig, 1999). Les groupes qui ont gagné le contrôle d'ICANN ont invoqué ce voile de légitimité technique pour minimiser la

critique. Même les avocats d'ICANN, pourtant dépourvus de compétence technique, ont justifié leurs prises de position par une prétendue neutralité de l'expertise technique (McLaughlin, 2000).

ICANN utilise le contrôle de l'adressage sur Internet comme levier d'une politique publique mondiale. A travers ICANN, la technologie a modelé la société, des technologues ont pris des décisions politiques majeures et des groupes d'intérêts ont exploité la légitimité technologique. On a peut-être ici le schéma régulateur de l'infrastructure informatique mondiale du siècle prochain, et c'est ce qui nous importe.

ICANN
et la gouvernance d'Internet

Hans Klein

Document de réflexion

ICANN et la gouvernance d'Internet

Hans Klein

La gouvernance d'Internet

Internet est souvent salué comme un royaume d'anarchie bienveillante, où la fibre est solidement établie. C'est une « hydre moderne » capable de contourner la réglementation (Fromkin, 1999, p. 129) et un « espace hors contrôle » (Lessig 1999, p. 218). Comme le dit John Perry Barlow, chantre de l'Internet, « *Ô gouvernements du monde industriel ... vous n'avez point de souveraineté là où nous nous rassemblons.* » (cité in Lessig, 1999, p. 218).

Pour le dire de façon moins pittoresque, Internet met à l'épreuve la *gouvernance*. J'entends par « gouvernance » l'existence d'une quelconque autorité capable de créer pour l'usage d'Internet des règles globalement applicables et renforcées par des sanctions. La gouvernance d'Internet existe sous des formes diverses et partielles (salons de *chat* sur AOL, ou réglementation des ordinateurs à l'intérieur du territoire national), mais, dans l'ensemble, Internet ne possède pas de système cohérent et efficace pour établir et imposer autoritairement des règles. Cela s'explique tant par les caractéristiques de la technologie (qui

rendent difficile tout contrôle) que par l'expansion mondiale des communications *via* Internet (qui crée un conflit de juridiction entre les régulateurs gouvernementaux).

Cette dimension « ingouvernable » d'Internet, pourtant, est en train de changer. Dans son livre *Code* (1999), Lawrence Lessig analyse diverses stratégies visant à éliminer l'anonymat des internautes et à faciliter l'application de lois contraignantes. Exemple récent : à la suite d'un procès concernant la vente aux enchères sur Internet de souvenirs nazis, interdite en France, la société *Yahoo!* fut condamnée à détecter l'origine géographique des utilisateurs pour leur appliquer la législation sur les contenus en vigueur dans leur pays (AFP, 2000). Comme avec d'autres technologies antérieures, plus Internet se répand dans la société, plus on tâche de l'intégrer dans les structures réglementaires existantes.

Le développement le plus significatif de cette tendance à « gouverner Internet est la création d'ICANN (Internet Corporation for Assigned Names and Numbers). Créée en 1998, ICANN est une association privée à but non lucratif, ayant reçu le mandat officiel d'effectuer la coordination technique des ressources fondamentales d'Internet, tout particulièrement les noms de domaine (par exemple monordinateur.org). Bien qu'elle soit implantée en Californie, son autorité s'étend, directement ou indirectement, à tous les utilisateurs d'Internet.

ICANN a le potentiel de changer radicalement la nature d'Internet. En mettant en place tous les mécanismes nécessaires à la création, à la promulgation et au renforcement de la régulation,

1

ICANN rend possible, pour la première fois, une vraie gouvernance d'Internet. Internet ne sera plus désormais cette Hyde incontrôlable. Or, les mécanismes de gouvernance d'ICANN rendent possibles toutes sortes de régulations. A de nombreuses reprises, ces dernières ont été des tentatives de réglementation d'Internet sont apparues, signe d'un intérêt grandissant pour de tels mécanismes (Froomkin, 1997). Selon les points de vue, la création d'une capacité de gouvernance implique la promesse ou la menace d'une maîtrise de la frontière électronique.

Je vais présenter une analyse détaillée d'ICANN, pour rendre compréhensible le rapport mutuel entre technologie, administration et gouvernance, en expliquant comment le système d'adressage d'un réseau d'ordinateurs facilite un système de gouvernance. Pour ce faire, je commencerai par expliquer ce qu'est la gouvernance, le fonctionnement du système des noms de domaines sur Internet (DNS) et la manière dont le DNS permet la gouvernance.

Cette mise au point pourra éclairer la politique des décideurs comme celle des utilisateurs d'Internet. Le fait qu'Internet a un point de contrôle central et qu'ICANN exerce une politique publique globale est loin d'être communément admis. La reconnaissance de ces capacités de gouvernance justifie l'application des critères normatifs de légitimité, de responsabilité et d'équité à l'institution et à son fonctionnement. Notre étude participe d'ailleurs d'un ensemble croissant de travaux qui analysent politiquement ICANN dans la perspective de ses origines historiques (Mueller, 1999; Klein, 2001a), de son statut légal (Froomkin, 2000 ; Klein, 2001c) et de sa conception institutionnelle (Post, 1998).

Elle prend aussi en compte les débats théoriques portant sur le rapport entre systèmes technologiques et contexte social. Des études récentes sur la construction sociale de la technologie ont souligné l'influence des facteurs sociaux sur les modalités du changement technologique (Bijker, 1995 ; Bijker, Hughes, Pinch, 1987; Klein et Kleinman, 2002). De même, des spécialistes de la politique des techniques ont insisté sur le fait que concevoir un système informatique s'apparente à légiférer, dans la mesure où les deux activités engendrent des structures sociales qui contraignent le comportement humain (Lessig, 1999; Kapur, Klein, 2000). ICANN présente à l'évidence les caractéristiques d'une telle structuration sociale, dans la mesure où le système de noms de domaine (DNS) définit des paramètres importants de gouvernance.

Je considérerai tout d'abord les facteurs technologiques et institutionnels qui ont empêché la régulation d'Internet, puis je discuterai plus largement la notion de gouvernance. Ensuite j'examinerai le système des noms de domaine en tant que hiérarchie technologique et administrative, en identifiant les caractéristiques qui permettent la gouvernance. Suivra une analyse des mécanismes de gouvernance d'Internet, tels que copier-cliquer par ICANN. Puis, pour illustrer la manière dont les mécanismes de gouvernance fonctionnent en pratique, j'étudierai la politique publique mondiale d'ICANN à travers la façon dont elle a défini les droits de propriété pour les noms de domaine. Enfin je considérerai le problème de légitimité posé par ICANN et je m'interrogerai sur les aires de régulation envisageables pour l'avenir.

Le problème de la gouvernance d'Internet

Que l'on soit pour ou contre des régulations spécifiques, on reconnaît généralement que la régulation d'Internet s'est toujours avérée difficile. Copier une musique, des logiciels et d'autres formes de propriété intellectuelle devient de plus en plus aisé, et la multiplication des actions en justice à l'encontre de ceux qui violent la propriété ne représente sans doute

qu'une part infime des cas de copies non autorisées (Fryer, 1995). Des tentatives de contrôle des contenus [d'Internet] par des gouvernements nationaux ont buté sur la nature mondiale d'Internet et des conflits interjuridictionnels (Andrews, 1999).

Les barrières à la régulation proviennent en partie des caractéristiques de la technologie. Les communications d'Internet ne passent pas par un canal central mais, au contraire, par plusieurs réseaux indépendants, et les messages eux-mêmes se séparent en espèces de paquets qui suivent divers itinéraires de leur source à leur destination (Cerf et Kahn, 1974). De multiples émetteurs indépendants envoient de multiples paquets indépendants à travers de multiples canaux indépendants : il n'existe donc pas de canal central de communication qui pourrait servir de point de contrôle pour la promulgation et l'application des règles.

La régulation bute également sur des facteurs institutionnels. Internet met à l'épreuve les juridictions établies (Johnson et Post, 1997 ; Perrit, 1997). L'autorité publique relève de l'État,

La caractéristique de base est d'exercer son contrôle sur un domaine géographiquement défini (Schroeder, 1998). Or la nature « a-spatiale » d'Internet met en cause ces fondements géographiques de l'autorité publique (Holitscher, 1999). La discordance entre un réseau mondial et des règles nationales sape bien des tentatives réglementaires (Froomkin, 1997).

Pour comprendre l'essence de cette situation, il est utile de prendre du recul par rapport aux détails et de considérer la gouvernance d'un point de vue théorique. Qu'est-ce que la gouvernance ? Qu'est-ce qui est nécessaire pour gouverner ? Que requiert la gouvernance d'Internet ?

Dans son ouvrage *La démocratie et ses critiques* (1989), Robert Dahl explique ce qu'est la gouvernance et comment l'atteindre. Il identifie une série d'« hypothèses politiques » (p. 106-107) qui précisent les conditions minimales pour un système de gouvernance. Ces conditions, je les appelle les « mécanismes de la gouvernance ». En paraphrasant la définition de Dahl, on peut identifier quatre de ces mécanismes, dont le premier sera *l'autorité*. La gouvernance demande un gouverneur ou un souverain. Une entité - individu ou groupe - doit prendre les décisions politiques qui s'appliquent aux membres de la communauté. Un deuxième mécanisme de gouvernance est *la loi*. Les lois mettent en œuvre des décisions politiques, sous la forme soit d'une taxe, soit d'une autorisation, ou simplement d'une règle qui engage. Troisièmement, il faut un mécanisme pour imposer des *sanctions* qui permettent de punir ceux qui violent les lois. Enfin la gouvernance exige une définition de la *juridiction*. Celle-ci définit l'espace au sein duquel l'autorité peut appliquer ses décisions et où les lois sont applicables sous peine de sanctions. Ces quatre mécanismes rendent possible la gouvernance : *l'autorité* gouvernante peut prendre une décision politique qui s'appliquera à l'intérieur de sa juridiction, en incorporant cette décision dans des *lois* et en imposant des *sanctions* à tous ceux qui ne s'y conforment pas (cette analyse se retrouve dans l'appendice de *Code* [Lessig, 1999]).

Le caractère ingouvernable et tant vanté d'Internet résulte de l'absence de ces quatre mécanismes. La régulation est difficile parce que l'autorité, la loi, les sanctions et la juridiction ne sont pas assurées.

Or ICANN réalise ces quatre mécanismes à travers son contrôle du système de noms de domaine Internet (DNS). Contrairement aux autres aspects d'Internet, le DNS est centralisé : la communication par Internet soit décentralisée, l'adressage sur Internet est centralisé. Le DNS fournit le point de contrôle à partir duquel il est possible de réguler les utilisateurs. Le DNS est aussi une ressource essentielle, et comme tel fournit un moyen d'appliquer des sanctions aux utilisateurs : le refus d'accès aux noms de domaine est l'équivalent du bannissement d'Internet. En outre, le DNS définit en grande partie les juridictions d'Internet.

L'organisation logique du DNS répartit l'autorité sur des zones distinctes. Les fondements contractuels du DNS permettent de promulguer des règles. Associées les unes aux autres, ces caractéristiques rendent ICANN capable de gouvernance.

Mais pour comprendre ICANN, il faut d'abord comprendre le système des noms de domaines.

Le DNS et la gouvernance : état des lieux

Je vais analyser le DNS en deux étapes, le présentant d'abord sous sa forme simplifiée : un système unique et non distribué. Dans cette perspective, les caractéristiques de la ~~du DNS sont~~ plus visibles. J'étudierai par la suite la structure interne et distribuée du DNS et présenterai les divers mécanismes utilisés pour assurer la cohérence de l'administration et de la décision politique

Le DNS, point de contrôle d'Internet

Commençons par une réalité méconnue : Internet consiste dans la réunion de deux « systèmes », dont l'un vise la *communication* (les protocoles TCP/IP) et l'autre *l'adressage* (le DNS). Le système de communication est l'aspect le plus connu d'Internet. Il est extrêmement on pourrait même dire qu'il n'est pas un « système » mais plutôt une série de protocoles grâce auxquels des réseaux d'ordinateurs indépendants peuvent s'envoyer des données. C'est lui qui nourrit l'image d'Internet dans le grand public et les prétentions à l'« ingouvernabilité » (Froomkin, 1997).

Le système d'adressage - le DNS - est au contraire centralisé. Presque toutes les communications sur Internet en dépendent. On peut concevoir le DNS comme l'annuaire et les enseignements téléphoniques d'Internet. Avant qu'un ordinateur puisse communiquer avec un autre, il doit composer l'équivalent du « 12 », donner le nom de celui qu'il appelle, puis attendre la composition du numéro. C'est un préalable indispensable à la communication.

Chaque fois qu'un utilisateur clique sur un lien de page web ou envoie un e-mail qui comporte un nom de domaine, le DNS doit *résoudre* ce nom de domaine. Du point de vue de sa structure interne, le DNS consiste en une base de données et un service de recherche dynamique. Les entrées dans la base de données comprennent un identifiant alphanumérique convivial (le *nom de domaine*) et un identifiant numérique pour la machine (le numéro ou adresse *IP*, Internet Protocol). Ainsi, le nom de domaine d'un ordinateur serait *monordinateur.org*, et son numéro IP correspondant *12.34.56.78*. Le DNS reconnaît le nom de domaine et forme le numéro correspondant. Les ordinateurs qui effectuent cette opération s'appellent des *narre servers* (serveurs de noms). Une fois celle-ci effectuée, la correspondance par courrier électronique ou la communication sur le web peuvent s'engager

Ce processus à deux étapes est immédiatement perceptible avec la plupart des navigateurs (comme Netscape). Une fois que l'utilisateur a tapé le nom du domaine, le navigateur indique qu'il est en correspondance avec le DNS avec un message du genre : « Recherche de l'hôte... » Plusieurs secondes peuvent s'écouler avant que la résolution soit effectuée et que la communication entre ordinateurs puisse commencer. Parfois la résolution du nom échoue,

¹ Cette explication simplifie un peu les choses. De fait, si l'on utilise les numéros IP directement, on n'a plus besoin d'interagir avec le DNS pour communiquer *via* Internet. Note au lecteur : selon mon expérience, à toute affirmation concernant le DNS on peut trouver une exception. Merci d'en tenir compte en lisant cette partie de l'article, simplificatrice à l'extrême par ~~sturdé~~ de

comme par exemple quand une faute de frappe ou d'orthographe donne un message du genre « Impossible de trouver l'hôte... », et aucun numéro ne répond. En regardant les messages sur l'écran du navigateur, un utilisateur peut observer le processus de résolution du nom.

Au coeur du DNS se situe *l'espace de nommage* d'Internet. Celui-ci fournit une liste de (presque) tous les ordinateurs connectés à Internet ². A ce jour, l'espace de nommage contient des dizaines de millions d'entrées. Dans les statistiques sur la croissance d'Internet, les chiffres se réfèrent en général à l'étendue de l'espace de nommage, qui fournit une approximation du nombre d'utilisateurs individuels : puisque la plupart des ordinateurs qui figurent sur la liste du DNS sont des portails d'accès aux réseaux privés connectant un grand nombre d'utilisateurs individuels, le nombre d'utilisateurs est bien plus élevé que celui des entrées dans l'espace de nommage.

En d'autres termes, l'espace de nommage *est* Internet. Pour exister sur Internet, un ordinateur doit figurer sur la liste de l'espace de nommage. A défaut (donc sans nom de domaine et sans numéro IP), un ordinateur ne pourra pas être trouvé par d'autres. Enlever un ordinateur du listing de l'espace de nommage, c'est comme le bannir d'Internet, car l'ordinateur disparaît de la liste des ordinateurs adressables. Quelle que soit l'entité qui contrôle l'espace de nommage, elle contrôle aussi effectivement Internet. On reverra cela en détail plus loin.

Dans sa conception actuelle, l'espace de nommage doit se conformer à certains principes (IAB, 2000; ICANN, 2001). Les concepteurs du système prétendent que l'espace de nommage doit être *unique* et géré par une seule entité. Il ne peut exister qu'une seule base de données qui constitue le listing définitif des ordinateurs sur Internet. Il peut y avoir des milliers mais non pas des espaces de nommage indépendants : si c'était le cas, tout nom de domaine pourrait correspondre à des adresses IP différentes selon l'espace de nommage utilisé, ce qui ôterait toute fiabilité à la communication. Cet impératif technologique du caractère unique sous-tend la centralité du DNS, car toute communication utilise un espace de nommage unique et obligatoire. Le recours, sur Internet, à un espace de nommage unique (avec un administrateur unique) « ... est une nécessité technique, et non un choix politique » (IAB, 2000). (Si cette caractéristique n'était pas impérative, l'éventail des choix politiques serait largement ouvert.)

L'administration

Le DNS est plus qu'un système technique : c'est aussi un système administratif et politique. Poursuivant notre présentation simplifiée du DNS comme base de données unique et non distribuée, on peut l'examiner sous l'angle de l'administrateur unique et de l'autorité politique exclusive. L'entité *d'autorité politique* formule des règles générales pour tout changement apporté à l'espace de nommage, décidant, par exemple, des noms de domaine admissibles, du coût d'enregistrement dans l'espace de nommage et des restrictions sur l'ajout ou la suppression de noms. L'administrateur met en oeuvre ces décisions, en ajoutant, supprimant, ou modifiant les entrées dans la base de données pour refléter l'entrée, la sortie ou le changement de statut de divers ordinateurs. L'administrateur garantit également la fiabilité du serveur de noms.

² C'est peut-être trop dire. Certains ordinateurs figurent sur la liste plusieurs fois. D'autres n'y figurent peut-être pas du tout et ne peuvent être contactés qu'en tapant l'adresse IP directement. Dans la majorité des cas, pourtant, un ordinateur sur Internet = une entrée dans l'espace de nommage du DNS. Or, comme on le verra plus loin, la plupart des ordinateurs présents dans le DNS sont pas des ordinateurs individuels mais des portails d'accès aux réseaux privés au sein desquels existent des ordinateurs individuels.

L'obligation du caractère unique du DNS implique que l'autorité politique et l'administrateur exercent un pouvoir de type monopolistique. Il y a impérativement un espace de nommage unique, géré par un administrateur unique qui, à son tour, est sujet à l'autorité politique unique.

« La conception commune le fonctionnement du protocole du DNS sont puissamment conditionnés par l'existence d'un propriétaire ou administrateur unique... » (IAB,

2000). La fiabilité du fonctionnement de l'espace de nommage est à ce prix. Directement ou indirectement, cet administrateur unique du DNS passe un contrat avec tout réseau connecté à Internet. Ainsi, la centralisation administrative et politique va de pair avec la centralisation technique du DNS.

L'administrateur du DNS s'appelle aussi un *registry*. Pour qu'un ordinateur soit disponible sur Internet, l'utilisateur doit demander à l'administrateur d'être *enregistré*. Le registry enregistre l'ordinateur en ajoutant le couple nom-numéro de l'utilisateur à l'espace de nommage.

Le mécanisme légal qui relie l'autorité politique centrale aux utilisateurs est *un contrat*. Internet est un réseau de réseaux : la plupart des ordinateurs enregistrés dans l'espace de nommage sont en fait des portails d'accès à des réseaux privés, gérés à leur tour par des administrateurs de réseau. Chaque entrée dans le DNS s'accompagne d'un contrat entre l'administrateur central du DNS et un *administrateur de réseau*. Ce contrat précise les règles et conditions pour l'inclusion dans l'espace de nommage, c'est-à-dire la fourniture des coordonnées de contact, le règlement d'une cotisation annuelle, la reconnaissance du rôle de l'administrateur du DNS, etc.. Ainsi, tout réseau d'Internet passe un contrat avec l'entité unique qui supervise le DNS.

Le DNS et la gouvernance d'Internet

A partir de cette vision simplifiée du DNS, on voit comment la gouvernance est envisageable. Il suffirait de quelques modifications mineures pour mettre en oeuvre les quatre mécanismes de l'autorité, de la loi, des sanctions et de la juridiction.

Le DNS instaure une autorité centrale pour Internet. L'obligation du caractère unique de l'espace de nommage exige une autorité centrale unique dont les décisions s'appliquent à tous les serveurs dans l'espace de nommage. Pour faire de l'autorité politique du DNS une vraie entité régulatrice, il faudrait simplement que son champ de décision s'étende aux enjeux de politique publique, tels que la réglementation de la propriété intellectuelle ou le contrôle du contenu. Puisqu'il y a très peu de barrières techniques à une telle expansion, il s'agirait bien alors d'un choix politique. L'exercice de la gouvernance sur Internet exigerait donc simplement

d'élargir la gamme des sujets régulés par l'autorité politique du DNS.

Le DNS définit également le deuxième mécanisme de gouvernance : la loi. La loi d'Internet s'exprime dans les contrats pour l'enregistrement des noms de domaine. Les contrats avec les administrateurs de réseaux détaillent les règles à respecter. Pour réguler de plus vastes questions, il suffirait d'élargir la formulation des contrats.

Troisièmement, le DNS intègre un puissant mécanisme de sanctions : le refus d'un nom de domaine (par exemple, suppression du couple nomnuméro d'un utilisateur du listing de l'espace de nommage). C'est le pouvoir de bannir : les administrateurs de réseaux refusant de s'enformer aux règles précisées dans leurs contrats pourraient être éliminés de l'espace de nommage et contraints à la disparition informatique. L'enregistrement des noms est donc conçu comme un privilège, révoquant en cas de transgression.

6

Le DNS résout tout aussi nettement le problème de la juridiction. La juridiction de l'autorité politique du DNS s'étend à tout ordinateur relié à Internet, mais ne va pas plus loin. C'est le contrat d'enregistrement qui manifeste la juridiction. Tout administrateur de réseau est lié contractuellement à l'autorité politique du DNS.

C'est ainsi que le système de noms de domaines fournit les moyens de la gouvernance. Il suffirait de quelques changements mineurs pour conforter chaque mécanisme. L'autorité politique du DNS n'aurait qu'à élargir son champ de régulation pour inclure des réglementations plus larges dans les contrats signés avec les administrateurs de réseau. Le refus d'un nom de domaine fournit un mécanisme suffisant pour sanctionner ceux qui ne se conforment pas aux règles. Et la juridiction de l'autorité politique s'appliquerait exactement à Internet, ni plus ni moins.

Mais pour assurer plus complètement la gouvernance d'Internet il faut considérer deux problèmes supplémentaires. Le premier est pratique : il faudrait trouver le moyen d'étendre l'autorité politique jusqu'à l'utilisateur individuel. Le contrat d'enregistrement du nom de domaine étant convenu entre l'autorité centrale et un administrateur de réseau, les utilisateurs individuels ne sont pas directement soumis à ces réglementations. La régulation des utilisateurs individuels impliquerait un *contrat aval*. Les administrateurs de réseau demandent en général aux utilisateurs de signer un accord lorsqu'ils prennent un compte, et cet accord avec l'utilisateur pourrait reprendre les termes du contrat des administrateurs. Ainsi une seule série de règles irriguerait tous les niveaux, de l'administrateur central du DNS aux administrateurs de réseaux locaux et, dès lors, à tout utilisateur. De façon indirecte, tous les utilisateurs d'Internet se verraient alors régulés par l'administrateur central du DNS. Toute violation du contrat par l'utilisateur pourrait faire interdire d'accès son compte. Et les administrateurs de réseau ne réussiraient pas à imposer des contrats « aval » avec leurs utilisateurs se soumettant au refus du nom de domaine, c'est-à-dire au bannissement d'Internet. Bien qu'un tel contrat reste aujourd'hui théorique, il est néanmoins tout à fait envisageable. Dans un paragraphe ultérieur, je résumerai les types de régulation qui ont été ou qui pourraient être instaurés au moyen

d'un tel système.

Une deuxième considération à propos de la gouvernance est de nature plus normative. Si l'autorité politique du DNS devenait un régulateur à visée générale, il faudrait alors repenser fortement sa *légitimité*. Avec l'extension de sa capacité décisionnelle, son autorité devrait se fonder sur un principe de compétence. Ce serait le cas si l'on plaçait l'autorité politique ultime entre les mains des gouvernements ou d'une institution représentative constituée à cet effet. Comme on le verra plus loin, quand l'autorité politique fut confiée à ICANN, celle-ci adopta un processus représentatif pour assurer sa légitimité.

Jusqu'ici, j'ai développé une hypothèse simplificatrice : l'espace de nommage d'Internet se compose d'une seule base de données centralisée. Au tout début du développement d'Internet, c'était le cas. Dans les années 1970, l'espace de nommage tout entier se trouvait dans un seul fichier appelé « hosts.txt » (Froomkin, 2000). A partir de 1983, pourtant, la croissance continue du réseau conduisit les chercheurs à reconceptualiser l'espace de nommage et à le fragmenter en pièces multiples et interconnectées. L'espace de nommage est moins centralisé que je ne l'ai représenté jusqu'ici, et cette décentralisation rend bien plus complexe la gouvernance d'Internet. Je vais maintenant procéder à l'analyse de cette architecture complexe.

7

Le DNS comme système distribué

L'espace de nommage est une base de données *distribuée*. Théoriquement toutes les données pourraient être incluses dans une seule base de données centrale, comme décrit plus haut. Mais, puisqu'à chaque seconde ont lieu des milliers de requêtes de noms, un ordinateur central en charge du DNS serait facilement débordé. L'espace de nommage est donc distribué entre de multiples ordinateurs pour partager la tâche.

L'espace de nommage consiste en une collection de bases de données partielles, séparées les unes des autres, tournant sur des ordinateurs distincts. Chaque base de données partielle s'appelle un *fichier-zone* (ou

zone »). Une zone comprend un sous-ensemble de la liste générale de paires nom-numéro. À chaque zone est associé un *serveur de noms* (ou « serveur » - un logiciel pour la résolution des noms) et un *ordinateur hôte* (ou « hôte » - le matériel où se logent le dossier de zone et le serveur de noms). Ainsi l'espace de nommage tout entier est un système distribué de bases de données et de résolution de noms dont la pierre angulaire est la triade fichier-zone / logiciel du serveur de noms/ordinateur-hôte.

Comme pour toute base de données distribuée, le rapport entre les membres est soigneusement structuré. Les diverses zones sont *liées* entre elles pour former une hiérarchie

pyramidale inversée ou un arbre à l'envers (avec les racines en haut). Au sommet de la hiérarchie se trouve une zone unique, la *racine*. Cette zone-racine est reliée à de multiples zones situées juste en-dessous, reliées à leur tour à de nombreuses autres zones inférieures, etc.. (C'est la même structure qu'on retrouve pour les dossiers d'un ordinateur personnel.) Les strates de la hiérarchie sont faciles à identifier : la zone-racine est liée aux zones « haut niveau », qui sont reliées à leur tour à des zones de « deuxième niveau », viennent ensuite les zones de « troisième niveau », etc..

Bien qu'une zone donnée puisse être reliée vers le bas à de multiples zones, elle ne peut être reliée vers le haut qu'à une seule. De façon directe ou indirecte, toutes les zones sont reliées vers le haut à la zone-racine unique. L'existence d'une racine unique dans l'espace de nommage satisfait à l'obligation d'unicité.

Les sous-arbres dans ce système s'appellent des *domaines*. Un domaine est constitué d'une zone et toutes les zones inférieures. On parle souvent des noms de domaine selon leur niveau dans l'arbre. Ceux qui relèvent des zones de haut niveau s'appellent « domaines de haut niveau » (*top-level domains*, ou TLDs) ; ceux qui relèvent du niveau suivant sont des « domaines de deuxième niveau », etc.. Le domaine de la racine est l'espace de nommage global. L'ensemble du système constitue le « système des noms de domaines » ou DNS. Les termes « zone » et « domaine » sont souvent employés de façon interchangeable, mais la « zone » se réfère à un seul fichier et « domaine » à ce même fichier et tout autre fichier inférieur à lui dans son sous-arbre.

Un domaine possède un nom - qui, sans surprise, s'appelle un *nom de domaine*. Les noms de domaine de haut niveau les plus connus sont *com*, *.org*, et *net*. Le domaine le plus vaste dans l'espace de nommage, *com*, est relié à des millions de domaines d'échelon inférieur. Une adresse Internet comme *monordinateur.com* associe un domaine de deuxième niveau (*monordinateur*) à un domaine du premier échelon (*.com*). Une série de noms de domaine, où les niveaux sont séparés par des points, identifie de manière précise et unique tout ordinateur dans l'espace de nommage.

Cette hiérarchie distribuée définit les rapports de contrôle de haut en bas. N'importe quel fichier-zone

peut être modifié pour lier (inclure) ou délier (exclure) les zones situées plus bas que lui dans l'espace de nommage. Comme un pouvoir de vie ou de mort virtuelle... Quand un serveur de noms se connecte à la racine à travers une série de liens, il existe dans l'espace de nommage. Si l'on modifie un fichier-zone pour éliminer un lien, le ou les ordinateurs inférieurs à lui dans la hiérarchie seront exclus de l'espace de nommage. Chaque serveur situé dans la hiérarchie contrôle la route jusqu'à la racine pour les serveurs de niveau inférieur.

On peut illustrer ce processus par un exemple. Disons que je voudrais connecter ma société au courrier électronique par Internet. Je possède déjà un réseau interne, et maintenant je cherche à relier mon réseau à Internet. Pour ce faire, il faut d'abord que je connecte un ordinateur-hôte de mon réseau à l'espace de nommage, *i.e.* que j'enregistre le nom de domaine et l'adresse IP de l'hôte dans un fichier-zone du DNS. L'espace de nommage étant une base de données distribuée, il existe plusieurs fichiers-zones auxquels je pourrais me lier : un registry en Virginie gère un fichier-zone qui

s'appelle *.com*, un autre en Angleterre en gère un qui s'appelle *.uk*, ma maison-mère en un qui s'appelle *.holdingcompany* (qui, à son tour, est relié au fichier-zone *.com*).
 Quand j'enregistre mon hôte dans un fichier-zone disponible, il est intégré à l'espace de nommage et commence à exister sur Internet. Parallèlement, si mon entrée dans le fichier-zone se trouvait (si le nom de domaine était annulé), mon hôte disparaîtrait d'Internet. La modification du fichier-zone qui une permet d'entrer ou de sortir d'Internet ne dépend pas de moi mais de l'administrateur du fichier-zone immédiatement supérieur au mien, dont je dépends toujours pour être présent sur Internet.

L'administration

Dans une approche simplifiée, j'ai écrit que l'administration et l'autorité politique du DNS reposent sur un couple unique d'organisations. Dans le DNS distribué, *tout* domaine doit avoir une telle paire administration politique (j'en parlerai simplement comme « administrateur » ; dans certains cas, les deux peuvent relever de la même organisation). Ces organisations fonctionnent selon la structure distribuée de l'espace de nommage : l'administration globale du DNS est une hiérarchie multi-organisations, dans laquelle chaque administrateur exerce son contrôle sur les administrateurs des échelons inférieurs. Au sommet se trouve l'administrateur de la racine.

Chaque administrateur exerce un contrôle monopolistique sur son fichier-zone immédiat (qui assure l'exclusivité de sa portion de l'espace de nommage). D'ailleurs, tout administrateur exerce son autorité sur l'intégralité du niveau inférieur. Quand il enregistre un hôte de deuxième ou de troisième niveau, il *délègue* de l'autorité à un administrateur de niveau inférieur qui à son tour exerce le contrôle monopolistique sur ce fichier-zone inférieur. L'autorité tombe en cascade depuis l'administrateur de la zone-racine, responsable pour tout l'espace de nommage, jusqu'aux ordinateurs hôtes individuels des zones inférieures. Chaque administrateur est soumis aux politiques des entités supérieures. C'est ainsi que des politiques décidées à la racine peuvent être transmises à toute la hiérarchie pour s'appliquer, directement ou indirectement, à tous les administrateurs du DNS. En tant que groupe, les administrateurs sont les gardiens de l'espace de nommage et donc d'Internet.

Tout comme les fichiers-zone sont entrelacés, les administrateurs sont liés par des contrats. L'administrateur-racine formalise sa délégation d'autorité aux administrateurs inférieurs par un contrat, dont plusieurs articles peuvent devenir obligatoires dans les contrats subséquents. De cette manière, les règles peuvent circuler dans toute la hiérarchie jusqu'à l'administrateur de réseau individuel, ou même à l'utilisateur individuel, comme on l'a déjà vu.

On ne s'étonnera pas de ce que l'administration de la zone-racine soit d'une importance toute

particulière. Tous les autres hôtes sur Internet n'accèdent à l'espace de nommage que par une délégation d'autorité qui provient directement ou indirectement de la racine. L'autorité politique sur la racine - le pouvoir d'ajouter ou de supprimer les domaines de haut niveau - confère un contrôle direct sur tout domaine de haut niveau et un pouvoir indirect sur tout domaine de niveau inférieur. L'exercice de l'autorité sur la zone-racine s'étend à Internet tout entier.

Pour résumer, cette approche plus précise du DNS révèle une complexité technique et administrative de grande ampleur. Considéré dans son ensemble, le DNS est bien un point de contrôle centralisé d'Internet. Et pourtant, puisqu'il est un système décentralisé, le DNS possède une structure -interne qui compte sur le contrôle hiérarchique et les contrats pour rendre effectif son potentiel d'action politique unificatrice.

Les facteurs historiques dit DNS

On peut maintenant passer de l'analyse technique à une analyse historique. Notre propos jusqu'à présent dessinait le fonctionnement du DNS et de sa structure en tant que base de données distribuée. L'analyse historique mettra en lumière l'évolution de l'espace de nommage du DNS et de sa hiérarchie administrative.

Internet a vu le jour comme projet de recherche dans les années 1970, et les scientifiques de l'informatique qui l'ont développé ont formaté l'évolution de ses institutions administratives et politiques (Hafner et Lyon, 1998). Cette communauté de chercheurs a trouvé son assise dans des institutions comme l'Internet Engineering Task Force (IETF), l'Internet Architecture Board (IAB), l'Institut des sciences informatiques de l'Université de la Californie du Sud (ISI) et l'Internet Society (ISOC) (Leiner *et al.*, 2000).

Une personne en particulier a joué un rôle-clé dans le développement du DNS : le Dr. Jon Postel, informaticien à l'Université de Californie du Sud. Bénéficiant d'une bourse de recherche gouvernementale, Postel a exercé l'autorité politique sur la racine, dans le cadre de l'Internet Assigned Number Authority (IANA). A la tête d'IANA, Postel gère le fichier-zone de la racine, autorisait l'ajout de nouveaux TLD (domaines de haut niveau), sélectionnait les administrateurs auxquels il déléguait l'autorité et il accomplit d'innombrables autres tâches. Postel avait d'abord assumé ce rôle dans les années 1970 en tant qu'étudiant. A proportion de la croissance d'Internet, l'importance des décisions de Postel crût jusqu'aux années 1990, où elles eurent des implications mondiales. Cependant l'autorité politique sur la racine reposait toujours sur sa personne. Et, puisqu'il travaillait sous contrat avec le gouvernement, l'autorité finale demeurait officiellement entre les mains du gouvernement des États-Unis - mais, la plupart du temps dans les années 1980 et 1990 c'est Postel qui a exercé son autorité personnelle sur le DNS.

En 1984, dans un document connu sous le sigle RFC920, Postel, avec son collègue Joyce Reynolds, décrit la trajectoire d'évolution de l'espace de nommage (Postel et Reynolds, 1984). RFC920 établit le nombre de zones de haut niveau et leurs noms. Bien que l'espace de nommage se limite à un seul fichier-zone de racine, Postel et Reynolds annoncent en 1984 que l'échelon supérieur en comptera en quelque 250 fichiers-zone. RFC920 sert de canevas pour structurer l'espace de nommage et sa croissance future. Le nombre de fichiers-zones ne se fonde sur aucune nécessité technique, il aurait pu être plus grand ou plus petit.

RFC920 précise également les chaînes numériques d'identification des fichiers-zone. Les 250 TLD se divisent en deux classes de nommage : six TLD « génériques » (des « gTLD » : *.gov*, *.edu*, *.com*, *.mil*, *.net*), et 244 TLD codes-pays (des « ccTLD », ayant pour base la liste de référence ISO 3166-1 des codes-pays à deux chiffres, tels *uk* pour le Royaume Uni, *.fr* pour la France, *.jp* pour le Japon, etc.). Encore une fois, les chaînes numériques particulières utilisées dans les noms

de domaine n'ont aucune signification technique ; il suffit qu'elles soient uniques. Elles ont néanmoins une grande incidence politique, car elles donnent forme à des décisions concernant l'administration d'Internet. Les 250 TLD définissent un espace de nommage fondé en partie sur des fonctions (.com pour *commercial*, *mil* pour *militaire*, etc.) et en partie sur des identifiants géopolitiques (noms de pays). Décidés bien avant qu'Internet n'acquière une importance mondiale, le nombre de TLD et la signification y attachée vont avoir des conséquences à long terme.

RFC920 définit la structure et les conventions de nommage du DNS et sa mise en Oeuvre s'étale sur plusieurs années. L'instauration des TLD exige la sélection d'un administrateur pour gérer le fichier-zone et le serveur des noms. L'instauration des TLD génériques procède de façon très différente de celle des TLD de codes-pays : les premiers sont sélectionnés par le gouvernement des États-Unis, les seconds choisis par IANA.

Postel et IANA possèdent l'autorité politique sur la racine, mais l'administrateur est une entreprise privée : Network Solutions, Inc. (NSI), qui administre et exerce l'autorité politique sur *com*, *net*, et *org*. NSI prend ses ordres d'IANA, mais travaille en réalité sous contrat avec le gouvernement des États-Unis.

La croissance du domaine *com* procure à NSI richesse et puissance. Lorsque le gouvernement des États-Unis ouvre Internet aux usages commerciaux, en 1994, l'enregistrement *en.com* explose. A la fin des années 1990, *com* atteint plus de dix millions d'enregistrements - plus de la moitié de tout l'espace de nommage. Cette concentration ne relève pas d'un caractère inné du DNS, mais provient d'un développement inattendu - la combinaison du bon marketing de NSI et de la large acceptation de la convention de nommage du DNS, qui identifie *com* comme LE domaine commercial. Au bout du compte, le domaine *com* représente une telle proportion de l'espace de nommage total qu'il rivalise d'importance avec la racine pour l'ensemble du réseau (Mittler, 1999). Des frais annuels de \$35 USD par nom de domaine enregistré permettent à NSI d'amasser des centaines de millions de dollars de revenus du fait de son monopole sur le seul domaine commercial d'Internet.

En revanche, les administrateurs de TLD de codes-pays sont majoritairement, tout comme IANA, des sociétés sans but lucratif, souvent affiliées aux centres de recherches universitaires. Parce qu'IANA a défini les fichiers-zone en termes de codes-pays et créé un seul fichier-zone par pays, il n'y a qu'un seul administrateur par pays. Chacun d'eux constitue un monopole national implicite : le registre *.fr* est le seul pour la France, de même *uk* pour le Royaume-Uni, etc. Même s'il n'y a aucune base technique pour les monopoles nationaux, la convention de nommage de RFC920 génère un tel système. En termes d'organisation, le système des monopoles nationaux rappelle celui des sociétés nationales de téléphone (les PTT), qui opéraient en tant que monopoles nationaux dans la plupart des pays.

En octobre 2000, l'espace de nommage global compte plus de 30 millions de paires numéros (NetNames, 2000). Vu qu'IANA n'a pas étendu le nombre de domaines de haut niveau depuis la sortie de RFC920, ce sont les domaines de deuxième niveau qui ont connu la plus forte croissance. La majorité relève du TLD, *.com*, où NSI a enregistré plus de 18 millions d'hôtes. Les TLD en *.org* et de *.net*, également gérés par NSI, abritent 5 millions d'hôtes supplémentaires. Le reste de l'espace de nommage se distribue pour l'essentiel en divers TLD de codes-pays. À la tête d'IANA, Jon Postel supervise la délégation d'autorité aux nouveaux administrateurs.

Le DNS de la fin des années 1990 est encore bien plus complexe que le système décrit ici. D'abord, il est décentralisé. En 1983 le DNS a été créé comme une base de données distribuée (Mockapetris, 1983). Puis, au fil des ans, de nombreux développements non techniques ont formaté le système. La majorité des TLD portent des identificateurs de codes-pays, qui les

associent aux gouvernements nationaux. Un fichier-zone dans la hiérarchie *.com*, contient tout l'espace de nommage (battant ainsi en brèche la décentralisation). Dans une communauté de petits administrateurs à but non lucratif, Network Solutions commence à émerger comme un acteur du commerce. Et surtout, l'autorité politique sur l'ensemble du DNS est concentrée sur une seule personne, Jon Postel. La complexité du DNS est lourde de conflits potentiels.

DNS et gouvernance

Cependant le DNS peut toujours permettre d'exercer les mécanismes de la gouvernance. Bien que des accords plus complexes que ceux qu'on a mentionnés soient nécessaires, un DNS décentralisé rend possibles l'autorité, la loi, les sanctions, et les juridictions. Dans cette section je discuterai de quelle manière la technologie du DNS rend théoriquement possible la gouvernance.

La décentralisation n'a pas d'effet majeur sur la mise en oeuvre de deux mécanismes : la loi et les sanctions. Même si elle engendre de multiples niveaux hiérarchiques, les contrats-aval continuent néanmoins les règles jusqu'aux utilisateurs. La décentralisation exige une succession de contrats en cascade, mais elle ne remet pas en cause ce mécanisme. De même, le refus (d'accès) à un nom de domaine est une sanction efficace. Si tout administrateur dans l'espace de nommage, de la racine à l'étage le plus bas, exerce un contrôle monopolistique sur son fichier-zone, chacun peut déconnecter des hôtes de niveau inférieur. Ainsi l'enregistrement d'un nom reste un privilège, révoquant si l'enregistreur viole les règles.

Au contraire, la décentralisation entrave l'exercice des deux autres mécanismes de gouvernance. Elle fragmente l'autorité politique et la juridiction, surtout dans les domaines de codes-pays. Celles-ci restent unifiées à la racine : IANA peut réglementer tout l'espace de nommage et promulguer les règles à travers toute la hiérarchie. Mais dans les domaines de haut niveau (TLD), le risque existe d'une contradiction avec un autre échelon d'autorité. La distinction entre les TLD génériques (gTLD) et ceux des codes-pays (ccTLD) peut affaiblir l'unité d'autorité et de juridiction.

Les ccTLD sont associés aux pays, et par conséquent à l'autorité politique des gouvernements nationaux. Ceux-ci peuvent prétendre à exercer leur juridiction sur les ccTLD correspondants. Même si les domaines des gouvernements nationaux représentent un niveau inférieur à IANA dans la hiérarchie du DNS, IANA n'est pas en situation de revendiquer sur eux une quelconque autorité. L'institution de gouvernance d'Internet serait bien en peine de remettre en question le droit d'un gouvernement national à décider de sa politique publique. Même si les gouvernements ignorent le DNS (dans la majorité des cas), l'exercice proactif de l'autorité politique par IANA peut provoquer une réaction de leur part. Aussi est-il

difficile l'autorité politique sur la racine d'affirmer son pouvoir sur les ccTLD.

Autre source de complexité : la pléthore d'autorités au sein des ccTLD. Les TLD de codes-pays sont indépendants les uns des autres, et chacun peut décider de ses propres politiques dans son domaine, source de possibles divergences, voire de contradictions. La décentralisation du DNS a créé des centaines d'autorités, dont chacune peut implicitement prétendre à la juridiction sur son ccTLD. La gouvernance intégrée d'Internet apparaît donc impossible. La décision des ingénieurs informatiques d'organiser l'espace de nommage d'après les grandes lignes politiques dont témoigne RFC920 a fragmenté l'autorité et la juridiction.

Une gouvernance intégrée paraît possible, au contraire, dans les gTLD. IANA peut réguler les domaines tels que *.com*, *.org*, et *.net*, car ceux-ci ne sont pas redevables vis-à-vis d'autorités

12

extérieures au DNS. Quelle que soit l'autorité dont ils disposent, ils ne la détiennent que par délégation d'IANA. Or, les gTLD ont beau n'être qu'un sous-ensemble du total des domaines, ils se taillent néanmoins la part du lion en nombre d'utilisateurs. L'autorité effective dans ces domaines s'étend de fait à la majorité des internautes.

Le DNS ne permet pas une gouvernance pleine et entière, mais autorise un certain degré de gouvernance. L'exercice d'une autorité et d'une juridiction uniques dans les domaines *.com*, *.org* et *.net* est aisé. D'ailleurs, vue la grande concentration d'enregistrements dans les gTLD, cette juridiction concerne également la plus grande part des utilisateurs. L'autorité politique de la racine peut les réguler *via* les contrats-aval assortis de la menace du refus d'accès au nom de domaine. La fragmentation de l'autorité demeure, mais elle est limitée.

Pour la limiter davantage, IANA, tout comme les gouvernements nationaux cherchent à coordonner les diverses politiques. Bien qu'il y ait des centaines de ccTLD, les enregistrements ne sont pas également répartis. Des domaines tels que *.jp* ou *.uk* comptent beaucoup plus d'enregistrements que d'autres, par exemple *.bg* (la Bulgarie). La coordination des ccTLD les plus importants avec IANA suffit à unifier les politiques, pour s'approcher d'une gouvernance intégrée.

Enfin, l'on peut revendiquer d'autant plus de cohésion politique que l'on a la possibilité de mettre la pression sur des ccTLD récalcitrants. Si un petit ccTLD hésite à appliquer quelque politique soutenue par IANA et par les grands gouvernements, son autorité peut être remise en cause. IANA peut exercer sa capacité de déconnecter un domaine de haut niveau ou de le affecter vers un administrateur plus conciliant. Ainsi les plus petits ccTLD peuvent se laisser persuader (ou intimider) d'adopter les politiques agréées par les plus grands. La cohésion politique générale ne peut qu'y gagner.

Avant de clore ce chapitre, il faut encore considérer le rôle du gouvernement des États-Unis. Ce dernier, grâce à Jon Postel et Network Solutions, revendique l'autorité finale sur le fichier-zone racine. IANA, autorité politique supérieure aux États-Unis, fonctionne sous l'autorité

politique des États-Unis. Instaurer les quatre mécanismes de gouvernance, en l'absence d'un changement de statut des États-Unis, serait en quelque sorte permettre à ce pays d'exercer l'autorité ultime sur Internet. Nouvelle cause de tensions avec les autres gouvernements nationaux qui se trouveraient subordonnés aux États-Unis.

Pour résumer, un DNS décentralisé ne peut permettre la réalisation pleine et entière des mécanismes de gouvernance. La loi et les sanctions peuvent s'appliquer, mais l'autorité et la juridiction sont fragmentées. La majorité des utilisateurs se situant dans des domaines génériques (les gTLD) peuvent être régulés par IANA. Mais soumettre l'espace de nommage à l'autorité d'IANA exigerait des négociations avec un nombre considérable d'autorités nationales autonomes.

D'IANA à ICANN

Ayant passé le DNS en revue, on peut se tourner désormais vers l'Internet Corporation for Assigned Names and Numbers (ICANN). Créée en 1998, et quoique non stabilisée à ce jour, ICANN met en oeuvre le potentiel de gouvernance du DNS, en se servant de l'adressage sur Internet comme d'un levier pour accomplir la gouvernance globale. ICANN n'a pas seulement créé des capacités de régulation, elle les a aussi utilisées : en 1999, elle a promulgué une décision de politique publique mondiale qui définit les droits de propriété intellectuelle sur les noms

13

de domaine. Je vais ici identifier les caractéristiques spécifiques d'ICANN aux moyens desquelles elle met en pratique l'autorité, la juridiction, la loi et les sanctions.

Commençons par planter le décor historique. A la fin des années 1990, le DNS est contesté de diverses parts. Internet a rapidement débordé ses institutions d'origine, notamment la « personnalisation » d'IANA, dont la légitimité se fondait sur la réputation d'un seul homme. Si quelque malheur arrivait à Jon Postel, IANA serait complètement déstabilisée. Une autre source de tension provient des entreprises qui, au nom de la concurrence, veulent ébranler le monopole de NSI : elles commencent à proposer d'autres espaces de nommage, d'autres TLD (par exemple *zoeb*), et des « registries » indépendants (Mueller, 1998). Ce qui fait peser de nouvelles menaces de fragmentation sur l'espace de nommage. La nature globale d'IANA pose un autre problème. L'Union internationale des télécommunications (ITU) de l'Organisation des Nations unies s'en mêle et cherche à revendiquer l'autorité sur l'espace de nommage. Des gouvernements nationaux et la Commission européenne s'y intéressent eux aussi, estimant que le contrôle exercé par les États-Unis sur cette nouvelle infrastructure informatique mondiale menace leur souveraineté. Des controverses naissent sur les questions de souveraineté et de juridiction. Des conflits sérieux émergent autour des noms de domaines correspondant aux marques déposées (par exemple, *coca-cola. conr*). L'organisation mondiale de la propriété intellectuelle (WIPO) de l'ONU, ainsi que des lobbies nord-américains font pression pour faire respecter le droit des marques déposées dans l'univers des noms de domaine (Shaw, 1997). Ce mélange politique est autant plus détonnant que les conflits se développent au rythme d'Internet ; chaque mois qui passe témoigne de la croissance exponentielle du réseau et de ses enjeux politiques.

Le processus par lequel la communauté des chercheurs, les titulaires de marques déposées, les entreprises de communication et les gouvernements nationaux se sont concertés pour créer une nouvelle institution à la place d'IANA a été décrit ailleurs (Mueller, 1999 ; Klein, 2001a). Je concentrerai mon attention sur le fruit de ce processus long et litigieux, c'est-à-dire ICANN, en analysant sous sa configuration de l'an 2000.

On comprend mieux ICANN si on la perçoit comme un ensemble d'institutions semi-autonomes. Cet ensemble comprend non seulement ICANN en tant que société mais aussi certaines entités externes, telles que le comité des gouvernements nationaux (GAC) et les administrateurs de la DNS. Pour bien distinguer entre ICANN vue comme un ensemble d'institutions et ICANN comme entité institutionnelle, j'appellerai celle-là « le système ICANN » et celle-ci simplement « ICANN ».

Les quatre mécanismes de gouvernance sont si profondément enracinés dans le système administratif d'ICANN qu'il est difficile de les identifier. Le paragraphe qui suit va analyser les caractéristiques d'ICANN dans leurs fonctionnalités relatives à la gouvernance. Je m'intéresserai tout d'abord à la façon dont ICANN a mis en oeuvre les mécanismes d'autorité et de juridiction, puis je me concentrerai sur les mécanismes de la politique et des sanctions.

L'autorité et la juridiction

L'autorité politique sur la racine est transférée de Jon Postel à la nouvelle instance. ICANN résout le problème de la stabilité : une personne est remplacée par une institution, ICANN peut fonctionner indépendamment d'un seul individu. ICANN résout aussi, au moins en partie, le problème du conflit intergouvernemental : en tant que société privée, elle stipule dans son règlement intérieur qu'aucun fonctionnaire ne peut être membre de son conseil d'administration. Ainsi, même si son autorité s'étend au monde entier, la nature de celle-ci est délibérément non gouvernementale et respecte ainsi la souveraineté des gouvernements

nationaux. En outre, son rôle étant simplement d'assurer la coordination technique de l'Internet, ICANN ne revendique aucune mission de politique publique.

La composition du comité directeur soulève un problème de légitimité. Certes une personne, Jon Postel, est remplacée par un conseil représentatif ; mais la légitimité issue de l'expertise et de la réputation personnelles est remplacée par la légitimité et la responsabilité reconnues aux représentants. Le comité directeur d'ICANN représente divers collèges sur une base fonctionnelle et géographique. Sur les dix-neuf directeurs, neuf représentent des groupements d'experts techniques, neuf autres les utilisateurs, le dernier n'est autre que le « patron » de l'organisation.

Le conseil d'ICANN est cependant soumis à une autorité supérieure : le gouvernement des États-Unis, dont le Département du Commerce (DoC) garde le contrôle de la racine, conservant

ainsi droit de veto sur les décisions politiques d'ICANN. En dépit de la privatisation d'Internet (qui fit grand bruit), les États-Unis n'ont jamais entièrement lâché prise. Comme l'expliquait un document officiel du DoC, « *le département du commerce n'a pas l'intention de transférer à quelque entité que ce soit son autorité politique sur le serveur-racine* » (DOC, 1999). Ainsi Internet n'est internationalisé et privatisé que sous la houlette du gouvernement des États-Unis.

En-dessous de la racine, les contrats étendent l'autorité d'ICANN et des États-Unis jusqu'aux administrateurs des gTLD et des ccTLD. Les TLD génériques s'intègrent plus aisément à l'organisation, puisqu'ils sont presque tous administrés par NSI et que cette entreprise subit la pression des États-Unis pour participer à ICANN. Après quelques négociations sur les modalités, ICANN se mettent d'accord en 1999. ICANN assure ainsi son autorité politique sur les domaines les plus peuplés. Les ccTLD sont plus circonspects, et jusqu'en 2001 ICANN a peu progressé dans ce domaine (ICANN, 2001). L'autorité politique hiérarchique ne s'y est pas établie et a perpétué l'instabilité pour l'ensemble du système.

Le conflit d'autorité implicite entre ICANN et les gouvernements nationaux se manifeste dans le Governmental Advisory Committee (GAC). Le GAC est un comité officiel consultatif; des gouvernements nationaux peuvent s'y rencontrer, débattre et coordonner leurs actions individuellement, chaque gouvernement national peut affirmer son autorité politique sur les fichiers-zone qui portent son code-pays. Les gouvernements nationaux peuvent aussi coordonner une politique décidée collectivement au sein du GAC.

Le GAC entend légitimer les prétentions de ses membres à exercer l'autorité politique. D'emblée il affirme que « *le système de nommage d'Internet est une ressource publique et en ce sens que ses fonctions doivent être administrées en vue de l'intérêt général ou partagé* » (GAC, 2000). En précisant que le DNS doit être un bien public, tout comme le spectre électromagnétique, le GAC ouvre la voie au contrôle gouvernemental. Ensuite le GAC associe cet intérêt commun à l'autorité des gouvernements nationaux : « *l'autorité politique publique ultime [domaine code-pays] demeure du ressort du gouvernement...* » (GAC, 2000). Ceci est la justification de la prétention des autorités nationales à exercer la juridiction sur les ccTLD.

ICANN prétendait que l'autorité des ccTLD dérivait de son autorité supérieure sur la racine. Si les administrateurs ne suivent pas les décisions politiques d'ICANN, celle-ci peut redéléguer l'autorité à une autre partie. Les gouvernements nationaux, affirmant que leur fichier-zone est une ressource publique, cherchèrent à placer les ccTLD sous leur propre autorité. Les administrateurs des ccTLD se trouvaient donc soumis à deux autorités - et ils en proposèrent une troisième, de leur cru, citant des documents officiels qui situent l'autorité dans « la communauté Internet locale » plutôt que dans ICANN ou les gouvernements (Postel, 1994). Cette perspective les rendait responsables vis-à-vis des utilisateurs d'Internet dans leurs pays

respectifs, et non vis-à-vis de leurs gouvernements ou d'ICANN.

Les membres du GAC cherchèrent à résoudre cette ambiguïté à leur profit en demandant à ICANN un pouvoir de veto sur les ccTLD identique à celui du gouvernement des États-Unis sur la racine. Le GAC proposa de transférer le pouvoir de redélégation d'ICANN aux

gouvernements nationaux : « *quand ICANN sera avertie par le gouvernement ou l'autorité publique concernée qu'un [administrateur] a enfreint les termes du contrat... elle devra agir en urgence pour réaffecter la délégation...* » (GAC, 2000). Les gestionnaires des codes-pays auraient donc eu accès à la racine qu'autant que leurs gouvernements le leur permettaient. ICANN refusa cette proposition, qui la subordonnait aux gouvernements nationaux. Au moment où cet article est rédigé, la fragmentation de l'autorité sur les ccTLD reste un problème non résolu.

Les débats du GAC eurent pour effet que la coordination des gouvernements nationaux s'applique à une large gamme de décisions politiques. Le GAC a entamé la rédaction d'un document de « bonnes pratiques » pour les gestionnaires de codes-pays, afin que les autorités nationales puissent standardiser leurs opérations (GAC, 2000). Une fois définies les politiques communes, tout gouvernement national peut promulguer et imposer ces pratiques dans sa propre juridiction.

Au sein d'ICANN, les mécanismes de l'autorité et de la juridiction reposent donc sur la conception même d'ICANN, sur le GAC et sur la pérennisation du rôle des Etats-Unis. La gouvernance effective d'Internet est envisageable dans les domaines où les membres d'ICANN et le GAC peuvent se mettre d'accord. En dépit de la fragmentation de l'autorité, la majorité des utilisateurs d'Internet, situés dans les gTLD, sont soumis à celle d'ICANN dans une juridiction unifiée.

La politique et les sanctions

Ayant examiné l'autorité et la juridiction, j'aborderai maintenant la question de la loi et des sanctions. Les premières réglementations d'ICANN s'appliquèrent aux domaines en *com*, *org* et à l'espace de nommage, ces derniers étant combinés dans un seul système partagé (*Shared Registry System, SRS*). Au moment où j'écris cet article, l'extension des réglementations d'ICANN sur les domaines des codes-pays n'est pas encore effective.

ICANN régule les utilisateurs, mais n'est pas directement en contact avec eux. Le SRS définit plutôt un système à quatre étages : ICANN au sommet, les utilisateurs à la base et deux sortes d'organisations intermédiaires : les « registries » et les « registrars ». Au sommet, ICANN utilise son autorité pour créer des réglementations. En dessous, les registries gèrent les fichiers-zones et font fonctionner les serveurs (comme décrit plus haut). Encore en-dessous, les registrars font l'interface avec les utilisateurs clients. Ce sont des détaillants en noms de domaines, chargés aussi du service après-vente et souvent de services annexes, comme la fourniture d'accès à Internet. Enfin, à l'étage inférieur se trouvent les administrateurs de réseaux. (Bien entendu, la plupart des utilisateurs d'Internet ne possèdent pas leur propre nom de domaine, mais utilisent celui d'une tierce partie comme *aol.com*, et constituent ainsi un cinquième niveau de la hiérarchie.)

Une cascade de contrats dévale tous les étages. Les réglementations d'ICANN sont contenues dans les contrats avec les registries, puis transmises dans leurs contrats avec les registrars, qui à leur tour insèrent dans leurs contrats avec les administrateurs de réseaux. Les décisions politiques circulent ainsi de haut en bas, d'ICANN aux registries jusqu'aux réseaux privés. Les termes du contrat définissent les lois d'Internet.

A chaque niveau, le contrat avec ICANN est garanti par la menace d'un refus d'accès au nom de domaine. Tout registry qui ne s'y conforme pas peut voir son domaine redélégué. De plus, les registrars, qui peuvent être privés d'accès aux registries et donc de leur capacité d'offrir les noms de domaine aux utilisateurs. Quant aux utilisateurs récalcitrants, ils risquent de voir leurs noms de domaine supprimés à l'intérieur de l'espace de nommage, ou même affectés à quelqu'un d'autre.

Le contrat ICANN d'accréditation de registrar (ICANN, 1999a) est le mécanisme primaire de promulgation de la loi. Toute organisation qui veut devenir registrar doit se conformer aux termes de ce contrat, y compris à la clause suivante, pourtant très vague : « *le registrar se conformera... à toute politique adoptée par ICANN...* » (Section II.D.1.b.i)³. Comme les politiques d'ICANN changent et que l'accord d'accréditation évolue (comme prévu dans la Section 11.0, « Le droit de remplacer un accord après sa mise à jour »), ainsi en est-il des conditions imposées à l'utilisation de tout nom de domaine. C'est ce « chèque en blanc » contractuel qui, d'évidence, accorde à ICANN le droit d'exercer la gouvernance sur un champ très large. Les termes du contrat sont répétés aux niveaux inférieurs entre les registrars et les utilisateurs ; la circulation fluide des régulations est ainsi assurée, d'ICANN aux registrars, et éventuellement aux utilisateurs. Au besoin, des sanctions sont explicitement prévues : « *Le locataire [du nom de domaine] reconnaît que son enregistrement du nom [de domaine] est susceptible de suspension, d'annulation, ou de transfert conformément à toute politique adoptée par ICANN... pour la résolution des conflits...* » (Section II.J.7.i).

Les mécanismes fondamentaux de gouvernance sont ici assurés par la circulation des contrats, assortie de la menace de refus du nom de domaine. Le contrat d'accréditation stipule les règles en vigueur sur Internet, que renforce le pouvoir de révocation d'un nom de domaine. Les utilisateurs d'Internet ne peuvent jouir de l'accès à l'espace de nommage que s'ils se conforment aux règles établies par ICANN; sinon, leur nom de domaine peut être suspendu, annulé, ou transféré.

Une politique publique mondiale

Mon exposé sur le DNS, la gouvernance et la conception institutionnelle d'ICANN a cherché à décrire et analyser des données objectives. Si l'on accepte la quadruple définition de la gouvernance, et si l'on admet que ces mécanismes sont bien à oeuvre dans ICANN, il n'est pas douteux qu'ICANN est capable d'assumer la gouvernance d'Internet. Jusqu'ici, on a très peu traité d'une double question : est-ce qu'ICANN exerce cette capacité ? ce système de gouvernance est-il légitime ? Le dernier chapitre va aborder ces éléments, beaucoup plus sujets à controverses.

La politique d'ICANN

ICANN possède la capacité de gouverner et l'a déjà exercée. ICANN a institué une politique publique mondiale. Je vais expliquer maintenant ce que signifie « instituer une

³ Ce passage de l'accord (Registrar Accreditation Agreement) est important mais pas particulièrement succinct. Le ^{texte} entier de la section D.1.b.i dit : « *D. Les obligations générales du registrar. 1. Pendant la durée de l'accord : b. le registrar se conformera à toute politique adoptée par ICANN cri ce qu'elle : i. est relative à l'une ou à plusieurs des*

questions: (A) toute question dont la résolution uniforme ou coordonnée s'avère raisonnablement nécessaire pour faciliter l'interopérabilité, la fiabilité technique et/ou le fonctionnement stable de l'Internet ou du DNS, (B) toute politique de registrar nécessaire dans les limites de la raison pour l'implémentation des politiques de consensus relatives aux registres, (C) la résolution de toute controverse à propos de l'enregistrement des noms de domaine (en tant qu'il revient à l'utilisation des noms de domaine en question) ;..

Page 19

politique publique », ainsi que la manière dont ICANN s'y est prise.

Aussitôt instaurées dans ICANN, les capacités de gouvernance furent mises en pratique. En août 1999, ICANN promulgua sa première décision politique importante : la Uniform Dispute Resolution Policy (UDRP), procédure visant à déterminer qui possède le droit de propriété sur un nom de domaine (ICANN, 1999b). L'UDRP constitue la première décision de politique publique d'ICANN à visée mondiale.

A la fin des années 1990, les noms de domaine ont pris de la valeur, des noms comme yahoo.com et amazon.com sont devenus des actifs commerciaux d'envergure. De sorte que surgissent des conflits autour du droit des noms quand des individus déposent une marque sur laquelle ils n'ont aucun droit (pour un nom de domaine quelconque), avec l'intention de la revendre à son propriétaire ; quand des titulaires de marques déposées tâchent d'interdire à d'autres utilisateurs l'utilisation d'une chaîne de caractères valorisée. Parfois les droits de propriété entrent en conflit avec les droits d'usage équitable ou la liberté d'expression (Kleiman, 1999). Source du problème : la législation existante ne permet pas de résoudre les conflits puisque la loi des marques est nationale et l'origine du conflit internationale. L'application des législations nationales en vigueur pour résoudre des conflits internationaux sur les noms de domaine est très cher et s'avère peu maniable (Littman, 2000).

L'UDRP d'ICANN a défini les procédures de résolution de tels conflits, établissant ainsi des règles de propriété. Selon une procédure alternative, des arbitres certifiés et privés décideront de la question des droits, en utilisant un critère défini par ICANN. Les décisions d'arbitrage seront exécutées par révocation ou le transfert du nom disputé. C'est un système « amiable » en ce sens que les parties non satisfaites par la décision de l'arbitre peuvent encore recourir aux enceintes juridiques existantes. Mais ces recours étant hors de prix, dans la majorité des cas c'est l'UDRP qui détermine les droits de propriété. Elle prend *de facto* force de loi.

La mise en oeuvre de l'UDRP illustre la manière dont ICANN se sert des quatre mécanismes de gouvernance à la fois. D'abord, l'UDRP a pris forme à travers les suggestions des permanents d'ICANN et l'expression de points de vue divers, et finalement elle a été adoptée par le conseil d'administration d'ICANN dans un exercice d'autorité. Ensuite, la décision politique a pris force de loi dans l'Accord d'accréditation des registrars : ICANN a fait de l'UDRP une condition de leur accès à l'espace de nommage, et ils se trouvent dans l'obligation de l'inclure dans leurs contrats détaillants (il faut qu'elle circule de haut en bas »). Troisièmement, l'UDRP est assortie de sanctions : tout utilisateur refusant d'y souscrire peut se voir refuser l'accès à l'espace de nommage et toute violation peut entraîner la suppression ou la réaffectation du nom de domaine de l'utilisateur. Enfin, l'UDRP s'applique à la juridiction d'ICANN. Elle régle les noms de domaine pour les *.com*, *.net*, et *.org*. Pour les domaines de codes-pays, où l'autorité d'ICANN ne s'applique

Directement, c'est aux administrateurs des codes-pays de décider d'adopter ou non l'UDRP. A
 jour c'est le cas dans certains domaines, mais non partout.

En instituant l'UDRP, ICANN a institué une politique publique mondiale. L'UDRP régleme un
 sujet d'intérêt général: les droits de propriété. Les règles concernant les marques déposées,
 le copyright, la propriété intellectuelle, sont traditionnellement établies par les gouvernements. La
 Constitution des Etats-Unis, par exemple, précise les règles de protection de la propriété
 intellectuelle sur les brevets. Au niveau mondial, le manque de régulation s'explique non
 parce que les règles de la propriété sont d'un moindre intérêt public, mais parce
 qu'aucune institution publique reconnue n'a établi de telles règles. ICANN a souhaité pallier ce manque.
 En instituant des règles mondiales sur la propriété, ICANN a pris une décision qui concerne
 aussi les valeurs publiques. L'UDRP n'aura peut-être pas une énorme incidence politique,
 mais les droits de propriété sur les noms de domaine concernent un champ de régulation
 assez

18

limité, mais elle représente un premier pas vers la prise de décision proprement politiques

4.

La légitimité

Si ICANN instaure une politique publique mondiale, il faut lui appliquer des critères
 politiques comme la légitimité, la responsabilité et l'équité. Et c'est autour de telles questions
 que sont apparues la plupart des controverses (Weinberg, 2000 ; Fromkin, Post, Farber, 1996b ;
 Klein, 2001b). Je résumerai brièvement certaines des interrogations qui ont surgi autour de la
 légitimité
 du Conseil d'ICANN.

La politique suivie par les Etats-Unis pour la création d'ICANN a été explicitée dans le «
 White
 Paper» du Département du Commerce. Il définit des principes, dont deux concernent
 particulièrement la légitimité : ICANN doit s'engager à mettre en place une « coordination
 ascendante » et une « représentation... (qui prenne en compte) la communauté vaste et
 croissante des utilisateurs d'Internet » (DOC, 1998b). Certains de ces L'important, ici, est le
 fait
 qu'ICANN assure une régulation globale.principes ont inspiré le règlement intérieur
 d'ICANN
 surtout en ce qui concerne les mécanismes de la représentation au sein du conseil
 d'administration (Klein, 2001a).

Dans de nombreuses instances ces principes furent malmenés. J'en mentionnerai trois. Le
 premier
 directeur d'ICANN était composé de neuf membres, à titre transitoire. Ce premier
 groupe fut nommé sans la participation ni même la consultation du public - ce qui suscita
 maintes
 protestations publiques et auditions devant le congrès des Etats-Unis. La sélection eut lieu à huis
 clos, processus décrit par Jon Postel lui-même comme «non démocratique et fermé» (Daley,
 1998). Ce fut pourtant ce Bureau qui promulgua l'UDRP.

La constitution du conseil d'administration d'ICANN fut tout aussi inégalitaire. Les directeurs
 représentant les neuf collègues d'experts furent installés en l'espace d'à peu près un an après la
 création d'ICANN, et ils cherchèrent aussitôt à réduire la représentation des utilisateurs
 d'Internet. Lors d'une série de réunions en 1999 et 2000, les directeurs nommés, tous

des experts, cherchèrent à éliminer, réduire, ou différer l'installation de directeurs élus (ICANN, 2000). A cette fin, ils révisèrent sans arrêt le règlement intérieur qui contraignait les actions du conseil. Comme le déclara un haut fonctionnaire lors d'une réunion tenue en juillet 2000, « *le conseil donne de plus en plus l'impression d'être extrêmement cavalier en ce qui concerne les modifications du règlement intérieur* » (Wilkinson, 2000). Peu après, le conseil décida de modifier une nouvelle fois le règlement pour retarder le dernier tour des élections de directeurs jusqu'en 2002 - soit quatre ans après la création d'ICANN.

Enfin, ce premier conseil afficha sa nette préférence pour que la représentation des utilisateurs d'Internet soit assurée par les professionnels de l'industrie. Lors du premier tour de l'élection des directeurs, presque tous les sièges furent pourvus par des candidats nommés par lui, dont beaucoup de personnalités issues des géants des télécommunications comme France Telecom, Fujitsu, Deutsche Telekom et Verizon (ICANN, 2000). Lors de la réunion d'ICANN de juillet 2000, cette tendance à favoriser l'industrie des télécommunications plutôt que les utilisateurs d'Internet sauta aux yeux d'un officiel australien, qui déclara : « [ICANN] *court le risque de se transformer de facto en association d'industriels* » (Twomey, 2000). La légitimité du conseil fut encore affaiblie par la tendance de certains groupes d'intérêt à rechercher (et, probablement, à obtenir) une influence disproportionnée sur ses décisions.

⁴ Je ne me demande pas si l'UDRP est de « bonne » ou de « mauvaise » politique publique. La substantialité de la régulation n'est en question. L'UDRP a suscité autant de louanges (Cohen, 2000) que de condamnations (Flynn, 2000 ; Mueller, 2001).

Dans la mesure où ICANN exerce une mission de politique publique, son manque de légitimité est frappant. Bien que les élections de l'an 2000 aient instillé une certaine dose de représentation des utilisateurs dans ICANN, elles ont échoué à instaurer le niveau de représentativité exigé par le règlement initial (Klein, 2001b ; Klein, 2001c).

La politique future

Les institutions ne sont pas des entités statiques : elles grandissent avec le temps et souvent modifient et élargissent leurs domaines d'activité. Tel semble être le cas pour ICANN. En tant qu'entité de gouvernance d'Internet, quelles pourraient être les politiques promulguées par ICANN à l'avenir ? Je me livrerai rapidement à quelques spéculations.

Le domaine d'expansion politique le plus probable est celui de la protection de la propriété intellectuelle. Un accroissement des pouvoirs dans ce domaine, revendiqué dès les débuts d'ICANN, serait cohérent avec ses objectifs initiaux (Froomkin, 1999a). L'UDRP pourrait être élargie jusqu'à donner des droits d'enregistrement spéciaux aux propriétaires de noms célèbres, de marques déposées, de noms géographiques, etc. ICANN deviendrait alors une instance régulatrice mondiale au service de la propriété et du commerce électronique.

Le contrôle de l'espace de nommage pourrait aussi servir de levier pour promouvoir la justice sociale. ICANN et les monopoles ccTLD pourraient collecter des fonds pour financer un service universel permettant de surmonter la division numérique du monde, les pays pauvres payant

leurs accès à Internet moins cher que les pays riches. Au cours de conversations privées, certains directeurs d'ICANN issus des pays en voie de développement ont défendu devant moi de telles orientations politiques.

Le potentiel politique d'ICANN pourrait également concerner la régulation des contenus. Des sites contrevenants pourraient être censurés par la révocation ou la réaffectation de leurs noms de domaine. Le premier à être ainsi sanctionné fut le site voteauction.com, qui proposait un contenu (un système de vente et d'achat de votes aux enchères en ligne). Le registrar du domaine annula l'enregistrement pour supprimer son contenu (Perritt, 2001). En théorie, ICANN pourrait renforcer ses impératifs de régulation en utilisant plus largement de tels mécanismes.

ICANN pourrait aussi devenir un instrument de taxation, permettant à un gouvernement de collecter l'impôt sur le e-commerce, ou dégageant les moyens de financer son propre personnel. Si les noms de domaine étaient accordés *via* une source unique, les utilisateurs devraient payer les frais correspondants, ou à défaut se verraient refuser l'accès. De fait, des législateurs nord-américains et des ccTLD mécontents ont déjà accusé ICANN de lever des taxes (McCullagh, Ward, 2000).

Enfin, ICANN pourrait devenir un instrument de la politique nationale des Etats-Unis. En temps de guerre ou de terrorisme, un pays qui s'opposerait aux Etats-Unis pourrait voir disparaître d'Internet ses domaines. Des enregistrements individuels pourraient être annulés ou transférés pour affaiblir des entités hostiles. Le rapport entre la politique d'ICANN et la politique nationale des Etats-Unis s'est déjà manifesté quand le Département du Commerce a approuvé l'ajout du domaine .ps - pour la Palestine - à la zone-racine. Bien que les Etats-Unis n'aient pas été guidés par un intérêt national étroit, l'affaire a fait grand bruit en raison de son potentiel conflictuel (Cisneros, 2001).

Les mécanismes de gouvernance étant mis en place, une « campagne d'infiltration » - l'expansion continue du champ réglementaire d'ICANN - semble possible. La combinaison de mécanismes efficaces de gouvernance et de mécanismes faibles de légitimité pourrait même

conduire à créer des règles en fonction des opportunités.

Conclusion

Admettre tout simplement qu'ICANN est chargée de la gouvernance d'Internet est lourd de significations. C'est contrecarrer des croyances bien établies et susciter des inquiétudes quant au type de gouvernance qui est en train de s'instaurer. Cela nous oblige à nous demander ce qu'il faudrait faire.

ICANN contredit la vulgate de l'anarchie bienveillante d'Internet. En fait, on découvre qu'Internet *peut* être contrôlé. Le DNS fournit la base d'un contrôle descendant, et ICANN utilise pour mener une véritable politique. Les implications de cet état de fait sont de plus

plus vastes et ne seront vraiment perçues qu'avec le temps. Pour cette raison, tout utilisateur d'Internet est tenu de s'intéresser à l'avenir d'ICANN.

Je terminerai par quelques observations sur le rapport entre technologie et société. ICANN révèle sous trois facettes la manière dont la technologie modèle la société.

Les traits objectifs de la technologie ont dessiné le système administratif et régulateur. En particulier, les caractéristiques techniques d'une base de données distribuée ont effectivement paramétré la politique. Le besoin d'un espace de nommage unique avec une racine unique a créé un point de contrôle central. De même, le besoin d'identifiants uniques (ainsi qu'un nom corresponde à un seul ordinateur-hôte) a créé des problèmes de contrôle et de monopole. La définition d'une zone *coin* unique, à l'intérieur de laquelle ne peut être enregistré qu'un seul *.ibm*, a engendré un système de registries monopolistiques et suscité des conflits autour du droit des marques. Peut-être toutes ces caractéristiques n'étaient-elles pas absolument nécessaires (bien qu'aucune alternative crédible n'ait été avancée, même par les plus critiques envers ICANN). On doit pourtant reconnaître que l'histoire les a si bien ancrées dans la conception et le fonctionnement du système qu'elles ont acquis un caractère quasi-nécessité. Toute tentative de changer le statut régulateur d'ICANN impliquera sans doute de concevoir une nouvelle technologie de base (ceci concerne en particulier l'exigence d'une racine unique sous le contrôle d'un administrateur unique).

La technologie a formaté la société d'une autre manière, qui concerne le rôle des ingénieurs dans l'établissement d'une politique. La sélection des noms de domaine des codes-pays fut une décision historique aux conséquences politiques majeures. Cette décision fut prise si tôt dans le processus du développement d'Internet que les seuls protagonistes furent les ingénieurs de recherche. Ceux-ci ont décidé qu'Internet devait être gouverné par les gouvernements nationaux. S'ils avaient choisi d'autres identifiants alphanumériques - couleurs, séquence de chiffres, table d'éléments -, la répartition « un domaine par pays » des registries ne serait guère fondée, non plus que l'affirmation subséquente de l'autorité nationale sur les registries. Les ingénieurs ont choisi d'organiser Internet sur le modèle des PTT nationales. Ils n'ont pu prendre de telles décisions que parce que celles-ci sont intervenues très tôt dans l'histoire du développement de la technologie, à un moment où eux seuls étaient concernés.

Troisièmement, la technologie influence la société dans la mesure où elle peut légitimer des décisions prises sous le sceau du secret. Quand des décisions politiques sont classifiées « techniques », il ne paraît pas illégitime qu'elles soient prises par des élites, derrière des portes fermées. La politique disparaît alors de la vue publique (Lessig, 1999). Les groupes qui ont gagné le contrôle d'ICANN ont invoqué ce voile de légitimité technique pour minimiser la

critique. Même les avocats d'ICANN, pourtant dépourvus de compétence technique, ont justifié leurs prises de position par une prétendue neutralité de l'expertise technique (McLaughlin, 2000).

ICANN utilise le contrôle de l'adressage sur Internet comme levier d'une politique publique

mondiale. A travers ICANN, la technologie a modelé la société, des technologues ont pris des décisions politiques majeures et des groupes d'intérêts ont exploité la légitimité technologique. On a peut-être ici le schéma régulateur de l'infrastructure informatique mondiale du siècle prochain, et c'est ce qui nous importe.

>Subject: The So Called Evidence is a Farce
>List-Owner: <<mailto:peacenowar-request@lists.riseup.net>>
>
>Excellent article- please distribute widely. This is posted at
><http://www.narconews.com>
>The So Called Evidence is a Farce
>I'm a retired Special Forces Master Sergeant. That doesn't cut much for
>those who will only accept the opinions of former officers on military
>matters, since we enlisted swine are assumed to be incapable of grasping
>the nuances of doctrine.
>But I wasn't just in the army. I studied and taught military science and
>doctrine. I was a tactics instructor at the Jungle Operations Training
>Center in Panama, and I taught Military Science at West Point. And
>contrary to the popular image of what Special Forces does, SF's mission is
>to teach. We offer advice and assistance to foreign forces. That's

>everything from teaching marksmanship to a private to instructing a
>Battalion staff on how to coordinate effective air operations with a
>sister service.
>Based on that experience, and operations in eight designated conflict
>areas from Vietnam to Haiti, I have to say that the story we hear on the
>news and read in the newspapers is simply not believable. The most cursory
>glance at the verifiable facts, before, during, and after September 11th,
>does not support the official line or conform to the current actions of
>the United States government.
>But the official line only works if they can get everyone to accept its
>underlying premises. I'm not at all surprised about the Republican and
>Democratic Parties repeating these premises. They are simply two factions
>within a single dominant political class, and both are financed by the
>same economic powerhouses. My biggest disappointment, as someone who
>identifies himself with the left, has been the tacit acceptance of those
>premises by others on the left, sometimes naively, and sometimes to score
>some morality points. Those premises are twofold. One, there is the
>premise that what this de facto administration is doing now is a
>"response" to September 11th. Two, there is the premise that this attack
>on the World Trade Center and the Pentagon was done by people based in
>Afghanistan. In my opinion, neither of these is sound.
>To put this in perspective we have to go back not to September 11th, but
>to last year or further.
>A man of limited intelligence, George W. Bush, with nothing more than his
>name and the behind-the-scenes pressure of his powerful father-a former
>President, ex-director of Central Intelligence, and an oil man-is
>systematically constructed as a candidate, at tremendous cost. Across the
>country, subtle and not-so-subtle mechanisms are put into place to
>disfranchise a significant fraction of the Democrat's African-American
>voter base. This doesn't come out until Florida becomes a battleground for
>Electoral College votes, and the magnitude of the story has been
>suppressed by the corporate media to this day. In a decision so lacking in
>legitimacy, the Supreme Court will neither by-line the author of the
>decision nor allow the decision to ever be used as a precedent, Bush v.
>Gore awards the presidency of the United States to a man who loses the
>popular vote in Florida and loses the national popular vote by over
600,000.
>This de facto regime then organizes a very interesting cabinet. The Vice
>President is an oil executive and the former Secretary of Defense. The
>National Security Advisor is a director on the board of a transnational
>oil corporation and a Russia scholar. The Secretary of State is a man with
>no diplomatic experience whatsoever, and the former Chair of the Joint
>Chiefs of Staff. The other interesting appointment is Donald Rumsfeld as
>Secretary of Defense. Rumsfeld is the former CEO of Searle
>Pharmaceuticals. He and Cheney were featured as speakers at the May, 2000,
>Russian-American Business Leaders Forum. So the consistent currents in
>this cabinet are petroleum, the former Soviet Union, and the military.
>Based on the record of Daddy Bush, in all his guises, and the general
>trajectory of US foreign policy as far back as the Carter Administration,
>I feel I can reasonably conclude that Middle Eastern and South Asian
>fossil fuels are one of their major preoccupations. Not just because this
>klavern has some very direct financial interests in fossil fuel, but
>because they surely know that worldwide oil production is peaking as we
>speak, and will soon begin a permanent and precipitous decline that will
>completely change the character of civilization as we know it within 20
>years. Even the left seems to be in deep denial about this, but the math
>is available. And, no, alternative energies and energy technologies will
>not save us. All the alternatives in the world can not begin to provide
>more than a tiny fraction of the energy base now provided by oil. This
>makes it more than a resource, and the drive to control what's left more
>than an economic competition.
>I further conclude that the economic colonization of the former Soviet
>Union is probably high on that agenda, and in fact has a powerful synergy
>with the issue of petroleum. Russia not only holds vast untapped resources
>that beckon to imperialism in crisis, it remains a credible military and
>nuclear challenger in the region.
>We have not one, but three members of the Bush de facto cabinet with

>military credentials, which makes the cabinet look quite a lot like a
>military General Staff. All this way before September 11th.
>Then there's the subject of the North Atlantic Treaty Organization. NATO
>might have expected consignment to the dustbin of the Cold War after the
>Eastern Bloc shattered in 1991. Peace dividend and all that. But it
>didn't. It expanded directly into the former states of the Eastern Bloc
>toward the former Soviet Union, and contributed significant forces to the
>devastation of Iraq-a key country in the world oil market, over which
>control translates into the ability to manipulate oil prices.
>NATO is a military formation, and the United States exerts the controlling
>interest in it. It seemed like a form without a function, but it remedied
>that pretty quickly.
>Then when Yugoslavia refused to play ball with the International Monetary
>Fund, the US and Germany began a systematic campaign of destabilization
>there, even using some of the veterans of Afghanistan in that campaign.
>NATO became the military arm of that agenda-the break-up of Yugoslavia
>into compliant statelets, the further containment of the former Soviet
>Union, and the future pipeline easement for Caspian Sea oil to Western
>European markets through Kosovo.
>You see, this is important to understand, and people-even those against
>the war talk-are tending to overlook the significance of it. NATO is not a
>guarantor of international law, and it is not a humanitarian organization.
>It is a military alliance with one very dominant partner. And it can no
>longer claim to be a defensive alliance against European socialists. It is
>an instrument of military aggression.
>NATO is the organization that is now going to thrust further along the
>40th parallel from the Balkans through the Southern Asian Republics of the
>former Soviet Union. The US military has already taken control of a base
>in Uzbekistan. No one is talking about how what we are doing seems to be a
>very logical extension of a strategy that was already in motion, and has
>been in motion for two decades. Once we recognize the pattern of activity
>designed to simultaneously consolidate control over Middle Eastern and
>South Asian oil, and contain and colonize the former Soviet Union,
>Afghanistan is exactly where they need to go to pursue that agenda.
>Afghanistan borders Iran, India, and even China but, more importantly, the
>Central Asian Republics of the former Soviet Union, Uzbekistan,
>Turkmenistan and Tajikistan. These border Kazakhstan. Kazakhstan borders
>Russia. Turkmenistan sits on the Southeastern quadrant of the Caspian Sea,
>whose oil the Bush Administration dearly covets.
>Afghanistan is necessary for two things: as a base of operations to begin
>the process of destabilizing, breaking off, and establishing control over
>the South Asian Republics, which will begin within the next 18-24 months
>in my opinion, and constructing a pipeline through Turkmenistan,
>Afghanistan, and Pakistan to deliver petroleum to the Asian market.
>The BBC was recently told by Niaz Naik, a Pakistani Foreign Secretary,
>that senior American officials were warning them as early as mid-July that
>military action for mid-October was being planned for Afghanistan. In
>1996, the Department of Energy was issuing reports on the desirability of
>a pipeline through Afghanistan, and in 1998, Unocal testified before the
>House Subcommittee on Asia and the Pacific that this pipeline was crucial
>to transport Caspian Basin oil to the Indian Ocean.
>Given this evidence that a military operation to secure at least a portion
>of Afghanistan has been on the table, possibly as early as five years ago,
>I can't help but conclude that the actions we are seeing put into motion
>now are part of a pre-September 11th agenda. I'm absolutely sure of that,
>in fact. The planning alone for operations, of this scale, that are now
>taking shape, would take many months. And we are seeing them take shape in
>mere weeks.
>It defies common sense. This administration is lying about this whole
>thing being a "reaction" to September 11th. That leads me, in short order,
>to be very suspicious of their yet-to-be-provided evidence that someone in
>Afghanistan is responsible. It's just too damn convenient. Which also
>leads me to wonder-just for the sake of knowing-what actually did happen
>on September 11th, and who actually is responsible.
>The so-called evidence is a farce. The US presented Tony Blair's puppet
>government with the evidence, and of the 70 so-called points of evidence,
>only nine even referred to the attacks on the World Trade Center, and

>those points were conjectural. This is a bullshit story from beginning to
>end. Presented with the available facts, any 16-year old with a liking for
>courtroom dramas could tear this story apart like a two-dollar shirt. But
>our corporate press regurgitates it uncritically. But then, as we should
>know by now, their role is to legitimize.
>This cartoon heavy they've turned bin Laden into makes no sense, when you
>begin to appreciate the complexity and synchronicity of the attacks. As a
>former military person who's been involved in the development of countless
>operations orders over the years, I can tell you that this was a very
>sophisticated and costly enterprise that would have left what we call a
>huge "signature".
>In other words, it would be very hard to effectively conceal.
>So there's a real question about why there was no warning of this. That
>can be a question about the efficacy of the government's intelligence
>apparatus. That can be a question about various policies in the various
>agencies that had to be duped to orchestrate this action. And it can also
>be a question about whether or not there was foreknowledge of the event,
>and that foreknowledge is being covered up. To dismiss this concern out of
>hand as the rantings of conspiracy nuts is premature. And there is a
>history of this kind of thing being done by national political bosses,
>including the darling of liberals, Franklin Roosevelt. The evidence is
>very compelling that the Roosevelt Administration deliberately failed to
>act to stop Pearl Harbor in order to mobilize enough national anger to
>enter the World War II.
>I have no idea why people aren't asking some very specific questions about
>the actions of Bush and company on the day of the attacks.
>Follow along:
>Four planes get hijacked and deviate from their flight plans, all the
>while on FAA radar. The planes are all hijacked between 7:45 and 8:10 AM
>Eastern Daylight Time.
>Who is notified?
>This is an event already that is unprecedented. But the President is not
>notified and going to a Florida elementary school to hear children read.
>By around 8:15 AM, it should be very apparent that something is terribly
>wrong. The President is glad-handing teachers.
>By 8:45, when American Airlines Flight 11 crashes into the World Trade
>Center, Bush is settling in with children for his photo ops at Booker
>Elementary. Four planes have obviously been hijacked simultaneously, an
>event never before seen in history, and one has just dived into the worlds
>best know twin towers, and still no one notifies the nominal Commander in
>Chief.
>No one has apparently scrambled any Air Force interceptors either.
>At 9:03, United Flight 175 crashes into the remaining World Trade Center
>building. At 9:05, Andrew Card, the Presidential Chief of Staff whispers
>to George W. Bush. Bush "briefly turns somber" according to reporters.
>Does he cancel the school visit and convene an emergency meeting? No.
>He resumes listening to second graders read about a little girl's pet
>fucking goat, and continues this banality even as American Airlines Flight
>77 conducts an unscheduled point turn over Ohio and heads in the direction
>of Washington DC.
>Has he instructed Chief of Staff Card to scramble the Air Force? No.
>An excruciating 25 minutes later, he finally deigns to give a public
>statement telling the United States what they already have figured out;
>that there's been an attack by hijacked planes on the World Trade Center.
>There's a hijacked plane bee-lining to Washington, but has the Air Force
>been scrambled to defend anything yet? No.
>At 9:30, when he makes his announcement, American Flight 77 is still ten
>minutes from its target, the Pentagon.
>The Administration will later claim they had no way of knowing that the
>Pentagon might be a target, and that they thought Flight 77 was headed to
>the White House, but the fact is that the plane has already flown South
>and past the White House no-fly zone, and is in fact tearing through the
>sky at over 400 nauts.
>At 9:35, this plane conducts another turn, 360 degrees over the Pentagon,
>all the while being tracked by radar, and the Pentagon is not evacuated,
>and there are still no fast-movers from the Air Force in the sky over
>Alexandria and DC.

>Now, the real kicker: A pilot they want us to believe was trained at a
>Florida puddle-jumper school for Piper Cubs and Cessnas, conducts a
>well-controlled downward spiral, descending the last 7,000 feet in
>two-and-a-half minutes, brings the plane in so low and flat that it clips
>the electrical wires across the street from the Pentagon, and flies it
>with pinpoint accuracy into the side of this building at 460 nauts.
>When the theory about learning to fly this well at the puddle-jumper
>school began to lose ground, it was added that they received further
>training on a flight simulator.
>This is like saying you prepared your teenager for her first drive on I-40
>at rush hour by buying her a video driving game. It's horse shit!
>There is a story being constructed about these events. My crystal ball is
>not working today, so I can't say why.
>But at the least, this so-called Commander-in-Chief and his staff that we
>are all supposed to follow blindly into some ill-defined war on terrorism
>is criminally negligent or unspeakably stupid. And at the worst, if more
>is known or was known, and there is an effort to conceal the facts, there
>is a criminal conspiracy going on.
>Certainly, the Bush de facto administration was facing a confluence of
>crises from which they were temporarily rescued by this event. Whether
>they played a sinister role or not, there is little doubt that they have
>at the very least opportunistically pounced on this attack to overcome
>their lack of legitimacy, to shift the blame for the encroaching recession
>from capitalism to the September 11th terror attack, to legitimize their
>pre-existing foreign policy agenda, and to establish and consolidate
>repressive measures domestically and silence dissent. In many ways,
>September 11th pulled the Bush cookies out of the fire.
>And given them the green light to begin constructing a long-term scenario
>within which to establish fascist control measures at home and abroad as
>a citadel for the ruling class in the catastrophic conjuncture that we are
>entering based on the end of oil.
>This elephant in the living room is being studiously ignored. In fact, the
>domestic repression has already begun, officially and unofficially. It's
>kind of a latter day McCarthyism. I participated in a teach-in at Chapel
>Hill, North Carolina, on the 17th of September, and though not a single
>person on the panel excused or justified the attacks, and every person
>there offered either condolences and prayers for the victims, we were
>excoriated within two days as "enemies of America." Yesterday an op-ed
>called for my deportation (to where, one can only guess). Now Herr
>Ashcroft is fast tracking the biggest abrogation of US civil liberties
>since the so-called anti-terrorism legislation after the Oklahoma City
>bombing - which by the way hasn't resulted in anti-terrorism but in the
>acceleration of the application of the racist death penalty. The FBI has
>defined terrorist groups not by whether any given group has ever acted as
>terrorists, but by their beliefs. Some socialists and anti-globalization
>groups have already been identified by name as terrorist groups, even
>though there is not a single shred of evidence that they have ever
>participated in any criminal activity. It reminds me of the Smith Act that
>was finally declared unconstitutional, but only after a hell of a lot of
>people served a hell of a long time in jail for the crime of thinking.
>I think this also points to yet another huge problems that the Bush regime
>was facing. Worldwide resistance to the whole so-called neoliberal agenda,
>which is a prettied up term for debt-leverage imperialism. While debt and
>the threat of sanctions has been used to coerce nations in the periphery,
>we have to understand that the final guarantor of compliance remains
>military action. For a global economic agenda, there is always a
>corresponding political and military agenda.
>The focal point of these actions in the short term is Southern Asia, but
>they have already scripted this as a worldwide and protracted fight
>against terrorism.
>It's far better than drug wars as a rationalization, and the drug war
>thing was being discredited in any case. Leftists are regaining power and
>popularity in Venezuela, El Salvador, Nicaragua, Ecuador, Colombia, the
>Dominican Republic, Haiti, Brazil, and Argentina. Cuba has gained immense
>prestige over the last few years. The empire is beginning to unravel. We
>can hardly justify intervention in these places by saying they are not
>towing the economic line by allowing the absolute domination of their

>societies by transnational corporations. That exposes the agenda. So we
>simply claim they are supporting terrorism.
>It's for all these reasons I say the left has missed the boat on this one,
>by allowing them to get away with rushing past the question of who did
>what on September 11th. If the official story is a lie, and I think the
>circumstantial case is strong enough to stay with this question, then we
>really do need to know what happened. And we need to understand concretely
>what the motives of this administration are.
>And we need to understand more than just their immediate motives, but
>where the larger social forces that underwrite our situation right now are
>headed. I do not think this administration is engaged in the deliberative
>process of a political grouping that is on top of their game. They are
>putting together some very deliberative technical solutions in response to
>a larger situation that it slipping rapidly out of their control. Like
>clear cutting. There's a very smart technology being employed to do a very
>dumb thing.
>What they are responding to is not September 11th, but the beginning of a
>permanent and precipitous decline in worldwide oil production, the
>beginning of a deep and protracted worldwide recession, and the unraveling
>of the empire.
>This brings me to a point about what all this means for Americans'
>security, which they are perfectly justified to worry about. The actions
>being prepared by this administration will not only not enhance our
>security, it will significantly degrade it. Military action against many
>groups across the globe, which is what the administration is telling us
>quite openly they are planning to do, will put a lot of backs against the
>wall. That can't be very secure.
>The concept of war being touted here is a violation of the principles of
>war on several counts, and will inevitably lead to military catastrophes,
>if you're inclined to view this from a position of moral and political
>neutrality.
>And the people who are now in possession of half the world's remaining oil
>reserves are subject to destabilization for which we can't even pretend to
>predict the consequences-but loss of access to critical energy supplies is
>certainly within the realm of possibility. Worst of all, we will be
>destabilizing Pakistan, a nuclear power in an active conflict with its
>neighbor, and we will be provoking Russia, another nuclear power. The
>security stakes don't get any higher, and Americans can ill afford to
>ignore nukes.
>And I think that this domestic agenda is a tremendous threat to the
>security of anyone who is critical of the government or their corporate
>financiers, and we already know that the real threats are against
>populations that can easily be scapegoated as the domestic crisis deepens.
>There is a very real threat right now of creeping fascism in this country,
>and that phenomenon requires its domestic enemies. Historically those
>enemies have included leftists, trade unionists, and racially and
>nationally oppressed sectors. This whole "state of emergency" mentality is
>already being used to quiet the public discourses of anti-racism, of
>feminism, of environmentalism, and of both socialism and anarchism. And
>while there is token resistance by officials to anti-Muslim xenophobia,
>the stereotypical images have saturated the media, and the government is
>already beginning to openly re-instate racial profiling. It is only a
>short step from there to go after other groups. We have long been prepared
>by the ideologies of overt and covert racism, and racism as both
>institution and corresponding psychology in the United States is nearly
>intractable.
>It's for all these reasons that I say emphatically that we can not accept
>anything from this administration; not their policies nor their bullshit
>stories. What they are doing is very, very dangerous, and the time to
>fight back against them, openly, is right now, before they can consolidate
>their power and their agenda. Once they have done that, our job becomes
>much more difficult.
>The left, if it has the capacity to self-organize out of its oblivion,
>needs to understand its critical roles here. We have to play the role of
>credible, hard-working, and non-sectarian partners in a broader
>peace-movement. We have to study, synthesize, and describe our current
>historical conjuncture. And we have to prepare leadership for the decisive

>conflict that will emerge to first defeat fascism then take political power.

>Rosa Luxemburg's words are truer than ever right now. We are not faced

>with a choice between socialism and capitalism, but socialism or barbarism.

>And what we can least afford are denial and timidity.

02 4 Gefallene Im Großen Widerstand

von: Revolutionäre Volksbefreiungsfront <press@dhkc.org>

=====

4 Gefallene Im Großen Widerstand

Unsere, Mit 72 Gefallenen Größer werdende Rechnung

Der Widerstand Jener, Die sich für eine unabhängige Türkei anstelle von der Amerikanischen Regierung aussprechen

Der Marsch der Patrioten gegen die Landesverräter

DIE PATRIOTEN DIE SICH IM WIDERSTAND FÜR BROT UND GERECHTIGKEIT BEFINDEN
WERDEN SIEGEN

Zeynep Arikant Gülbag, die genau 343 Tage lang die Worte "Für unser Volk, das bisher kein Glück erfahren konnte..." auf ihrem Stirnband trug, hat sich am 27. September in Armutlu zu den Helden unseres unbesiegbaren Volkes begeben. Ali Rıza Demir ist auf seinem Marsch, den er am 20. Oktober 2000 mit den Worten "Wir werden die Volksfeinde, Imperialisten und ihre Kollaborateure daran hindern, unser Volk auszubeuten und unser Land Stück für Stück zu verkaufen" angetreten hat, am 27. September, den 343. Tag des Widerstands in Armutlu unsterblich geworden.

Ayşe Bastımur krönte ihren Kampf, den sie opferbereit mit den Worten "Wir werden auf den Böden unseres Landes Welle für Welle zur Freiheitshoffnung werden" aufnahm, am 28. September, den 342. Tag ihres Widerstands in Ankara mit ihrem Martyrertum.

Özlem Durakcan ist in ihrem Widerstand, den sie vor 74 Tagen mit den Worten "Ich bin gegen Ungleichheit, Ausbeutung, Ungerechtigkeit, ich will ein Land in dem man menschlich leben kann" begonnen hat, am 28. September in Ankara gefallen.

Die Karawane zieht mit 4 Gefallenen in zwei Tagen weiter. Der Kampf gegen die Tyrannei der Pro-Amerikaner setzt sich gnadenlos fort.

Zeynep, Ali Rıza und Ayşe... Sie sind KämpferInnen der 1. Todesfastengruppe, unsere drei Helden und Herzen, die Massaker, Unterdrückung, Folter, Bestechung und Zeit nicht von ihrem Weg abbringen konnten.

Özlem... das junge Herz der Verantwortung, eine junge Anhängerin des TAYAD, die ihr Leben denen gewidmet hat, die sich der Unterdrückung widersetzen.

Zeynep, Ali Rıza und Ayşe waren WiderstandskämpferInnen der 1.

Todesfastengruppe. Sie wurden freigelassen. Sie haben nicht einmal für einen Moment an Verrat gedacht. Sie haben nicht gezögert. Sie haben auf das Gesicht des Verrats gespuckt, der über unsere Leichen gehend zum Vorschein trat, und ihren Weg fortgesetzt. Drei Fäuste prallten eine nach dem anderen auf das Gesicht des Verrats aus dem alles Leben gewichen ist.

Mit 4 Rosen haben wir die Brust der Unterdrückung mitsamt ihrer Kugel geschlagen. Während unser in einem Atemzug fortgesetzter Widerstand bald 1 Jahr vollendet hat, ist aus unseren Gefallenen mittlerweile ein Berg entstanden. Wir haben genau 72 Leben gegeben in diesem Kampf. Wir sind 72 Mal gestorben, seitdem die Oligarchie gegen das Volk der Türkei einen Krieg eröffnet hat.

In diesen 344 Tagen sind wir genau 72 Mal gestorben, aber die Hand des Widerstands hat nicht ein einziges Mal gezittert. Nicht ein einziges Mal konnten sie in die Knie gezwungen werden.

Die Geschichte ist nicht müde geworden, weiterhin unsere Heldenepen niederzuschreiben. Anatolien wurde durch unseren Schrei der Rebellion, der sich gegen die Tyrannei von seinen Böden erhebt, geehrt. Es hat die Namen unserer Helden mit rotem Stirnband an der Seite der würdevollsten Kinder einer tausende Jahre existierenden Menschheitsgeschichte verewigt.

DIE REGIERUNG MUSS VON IHRER ILLUSION UND IHREN LÜGEN ABWEICHEN

Den Krieg, den Amerika zur Stabilisierung seines Imperiums mit der Lüge "gegen den Terror" begonnen hat als Gelegenheit nutzend, hat sich die Oligarchie noch intensiver an Lügen wie "Das Todesfasten wird vom Ausland gelenkt" geklammert, um ihren mörderhaften Charakter legitim zu zeigen.. Wie bedauernswert.

Was gestern die lügnereischen Minister und Regierungen gesagt haben, wird heute schamlos und ungeniert vom heuchlerischen General Yasar Büyükanit nachgeplaudert.

Wir verkünden der ganzen Welt ein weiteres Mal; ihr sucht die Führungszentrale des Widerstands?

Das Zentrum des Widerstands, sein Stützpunkt, die ihn Leitenden und Ausführenden sind unsere Menschen, die den Tod in Kauf genommen haben.

Ihr könnt mit Euren Lügen nicht den Widerstand brechen, sondern Euch damit lediglich vor der ganzen Welt lächerlich machen.

Die Gefangenen haben dies mit den Worten "Selbst wenn ein Einziger von uns zurückbleibt, wird der Widerstand andauern" erklärt.

Es ist eine Illusion, auf das Ende des Widerstands zu warten, ohne daß die Forderungen erfüllt wurden.

Es ist eine Illusion zu erwarten, daß uns Zeit, Unterdrückung und Tod einschüchtern.

Gebt diese Illusion auf. Akzeptiert die Forderungen der Gefangenen ehe ihr eure Schuld und die Wut vergrößert.

Stoppt die Isolation.

Die 7. Todesfastengruppen, die am 26. September den Widerstand begonnen haben, sind der Beweis für die Entschlossenheit und dafür, wie brennend und unverzichtbar die Forderungen sind.

Allein die 4 Helden, die innerhalb von zwei Tagen gefallen sind, geben den besten Beweis dafür ab, daß der Widerstand einen großen Preis in Kauf nimmt.

Jene, die immer noch darauf warten, daß der Widerstand von selbst endet, sind entweder schwer von Begriff oder leben nicht in diesem Land.

WIR LEISTEN WIDERSTAND GEGEN DIE TYRANNEI DER PRO-AMERIKANISCHEN REGIERUNG

Diese Regierung hat weder mit dem Volk noch mit dem Land irgendetwas zu tun.

Das Volk ist hungig, arm, arbeitslos, mit Ausnahme einer Handvoll

Kollaborateure will niemand die Böden unseres Landes an das Amerikanische Imperium verschenken. Das Land ist zur Hölle geworden, aber das kümmert die Regierung überhaupt nicht.

Sie sagen "Volle Unterstützung an Amerika" und nichts weiter.

DIESE REGIERUNG EXISTIERT LEDIGLICH FÜR DIE INTERESSEN DES AMERIKANISCHEN IMPERIUMS.

Sie haben die Führung des Landes den Konsulen der USA und dem IMF ausgehändigt.

Der amerikanische Außenminister klatscht in die Hände und sie begeben sich Hals über Kopf in die USA. Sie sagen "Wir stehen bedingungslos in Eurem Befehl".

Das arme Volk des in einen Feuerherd verwandelten Anatoliens ruft "WIR SIND HUNGRIG", doch sie drehen sich nicht einmal nach ihm um.

Die Knechtschaft hat eine derartige Dimension angenommen, Bush spricht von "Kreuzzügen" und diese Regierung korrigiert ihn "es handelt sich um ein Mißverständnis". Die ganze Welt kritisiert Bush, aber diese Regierung gibt kein Wort von sich.

Diese Regierung sagt nur: "Völlige Unterstützung an Amerika". Diese Regierung will unser Land zu einem Bundesland Amerika's machen!

WIR WERDEN DIES NIEMALS ZULASSEN!

Kann das Amerikanische Imperium ein Volk, aus dem 4 Helden im gleichen Zeitraum wie ein Messer auf die Brust der Unterdrückung einstechen, zu seinem Untertanen machen?

Solange dieses Volk Helden wie diese hervorbringt, sich Hunderte von Freiheitskämpfern für Brot und Gerechtigkeit mit Aufopferungsgeist schmücken; können jene, die eine Operation zur Eroberung der Welt beginnen und sagen, daß Systeme, die auf Egoismus, Profit, Lügen, Plünderung, Raub, Ausbeutung und Massaker aufgebaut sind "die überlegenste Zivilisation sind", sowie deren Kollaborateure in unserem Land das Volk nicht zur Ergebung zwingen.

Unser Widerstand ist der Widerstand des nicht kapitulierenden Volkes.

Unser Widerstand ist der Widerstand der Patrioten gegen den Landesverrat.

Unser Widerstand ist das unzerbrechliche Monument der Losung "Unabhängige

Türkei" gegen die pro-amerikanische Regierung. Unser Widerstand ist gegen das Unterdrückungs- und Ungerechtigkeitsystem des US-Imperiums und seiner Kollaborateure, die einen Krieg ansagen, um auf der Welt keine einzige oppositionelle Kraft übrigzulassen. Als die Oligarchie zusammen mit dem IMF dem Volk den Krieg erklärt und als wichtigen Teil dessen die F Typ Gefängnisse an die Tagesordnung gebracht hat, stellten wir ihr unseren Widerstand entgegen; heute, wo Amerika allen unterdrückten Völkern der Welt den Krieg erklärt, geben wir unsere Antwort im Widerstand.

Wir verkünden der ganzen Welt, daß der Pro-Amerikanismus auf diesem Boden keine Ruhe finden wird. Unser Todesfastenwiderstand ist ein prunkvolles Manifest aller dem Volk angehörenden Werte gegenüber der pro-amerikanischen Kultur. Genau dann, wenn die Pro-Amerikaner denken, daß sie alle Gehirne mit der amerikanischen Kultur beschmutzen konnten; explodieren wir wie ein Vulkan, aus dessen Lava Geschwisterlichkeit, Solidarität, gegenseitige Unterstützung, Genossenschaftlichkeit, Opferbereitschaft, Liebe zum Volke und zur Heimat sprüht. Wir zerschmettern und verwischen den Schmutz des Egoismus, der Fäulnis und der Unmoral in ihren Köpfen.

DER KAMPF IST EIN KAMPF UM BROT

DIE FORDERUNG UNSERES VOLKES IST BROT UND GERECHTIGKEIT

Das amerikanische Imperium läßt die Weltvölker ohne Brot und Gerechtigkeit. Die Oligarchie der Türkei läßt ihr Volk ohne Brot und Gerechtigkeit. Diese Regierung bringt lediglich Unterdrückung und Hunger. Unser Volk wurde so weit gebracht, daß es heute nicht mehr imstande ist das trockene Brot, welches es gestern gegessen hat, zu kaufen.

Wie lange kann dieser Hunger, diese Ungerechtigkeit noch mit Tyrannei unterdrückt werden? Wie lange noch können sie die Rebellion der Hungernden und Verarmten mit Polizei und Armee aufhalten? Unser Volk muß sich sättigen. Es gibt keine einzige Kraft in der Welt, die eine solche Forderung unterdrücken kann.

GESCHWISTER! UNSER HUNGRIGES UND ARMES VOLK!

Wir müssen uns gegen das Unterdrückungssystem, welches von der Hilfsregierung des IMF aufgebaut wurde, organisieren. Wir müssen uns für Brot organisieren. Wir müssen uns für Gerechtigkeit organisieren. Wir können nicht ohne Brot und Gerechtigkeit leben.

Die 4 Gefallenen sind ein Aufruf zur Rebellion gegen den IMF, das US-Imperium und die pro-amerikanische Regierung.

Sie sind der Aufruf für ein Land, das nicht vom IMF regiert wird. Wenn wir Brot wollen, dann müssen wir uns vom IMF und seinen Kollaborateuren befreien.

Unser Widerstand ist der Aufruf für ein freies und unabhängiges System, in dem unser Volk in Satttheit lebt.

Wir werden dieses von unseren Gefallenen ersehnte System aufbauen.

UNSERE GEFALLENEN:

Zeynep ARIKAN GÜLBAG:

"Dieses Leben soll ihnen gewidmet sein!"

Im Jahre 1986 lernte sie Anhänger der Dev-Genc kennen. Sie machte einen Schritt vor in den Kampf. Unsere Genossin Zeynep befindet sich heute wie gestern im Kampf. Heute, sowie gestern hat sie auf vielen Gebieten des Kampfes Aufgaben übernommen. Sie war Führerin, Kommandantin. Am Vorabend des letzten großen Gefechts erklärte sie "Ich möchte nicht am Kampf teilnehmen sondern im Kampf ganz vorne stehen", und das ist ihr gelungen. Mit einer Bescheidenheit, die sagt "Ich versuche am 280. Tage des Todesfastens lediglich ein einfacher Soldat des Kampfes zu sein", ist sie als Kommandantin und Symbol der Herausforderung von Zeit und Unterdrückung, der Willensstärke und Entschlossenheit unsterblich geworden. Unsere Genossin Zeynep wurde 1968 in Malatya Hekimhan geboren. Im Kindesalter ist sie mit ihrer Familie nach Istanbul verzogen. Zwischen 1986-87 lernte sie in der Universität zu Istanbul die Anhänger der Dev-Genc kennen. Und sie hat ihren Kampf von 1987 bis 1992 innerhalb von Dev-!

Genc geführt. Während dieser Zeitspanne ist sie mehrmals festgenommen worden. Sie wurde aufgrund eines Protests gegen das Massaker in Maras festgenommen und befand sich für eine Weile im Gefängnis von Bayrampasa. Sie übernahm Aufgaben innerhalb des Dev-Genc- Komitees. Sie arbeitete bei der

Zeitung Mucadele. Mit Kazim Gülbag heiratete sie im März 1992. Die Bedingungen des Kampfes und die organisatorischen Bedürfnisse haben sie nach kurzer Zeit voneinander getrennt. Während sich Zeynep im Gefängnis von Ümraniye im Todesfasten befand, war Kazim Gülbag im Ausland. Er beteiligte sich am Widerstand, indem er seinen Körper in Brand steckte; Er hat seine Verbundenheit und Liebe zu seinen Genossen, seinem Volk und seiner Ehefrau gezeigt, indem er seinen Körper gegen die Unterdrückung einsetzte. Im Jahre 1993 wurde Zeynep seitens der Putschisten angeschossen. Zwischen 1995-96 befand sie sich zwecks Ausbildung auf verschiedenen Gebieten. Von 1996-1997 übernahm sie die Aufgabe als Kommando

ndantin innerhalb der Bewaffneten Propagandaeinheiten in Istanbul. Sie setzte ihre Unterschrift unter Aktionen, bei denen die Volksjustiz gegen Folterer und Mörder umgesetzt wurde. Am 4. August 1997 wurde sie festgenommen und ins Gefängnis gesteckt. Als die Gefängnisse des Typ F an die Tagesordnung kamen, befand sie sich im Gefängnis von Ümraniye. Sie trat ins Todesfasten. Der 19. Dezember, die Folter Zwangsernährung, Bestechung der Freilassung folgten eine nach dem anderen. Sie liebte ihr Volk, war ihren Genossen verbunden und ihren Gefallenen treu. Sie hat nicht gezögert. Sie wurde unsterblich mit dem Glauben an den Sieg.

ALI RIZA DEMIR:

"Ich bin in einer Gemeinschaft, selbstlos und ohne Rücksicht auf den Tod"

Er wurde am 9. November 1973 als Kind einer armen Kurdischen Familie in dem Dorf Adiyaman-Gökçay (Karikan) geboren. Er kannte die Repression und die Unterdrückung aus seinem Dorf. Er war das Kind eines Volkes, dessen Sprache und Kultur verboten war. Nach Abschluß des Gymnasiums in Malatya trat er im Jahre 1991 das Fach Textilingenieurwesen an der Technischen Universität zu Istanbul an. Hier lernte er die Anhänger von Dev-Genc kennen. Er hat ohne zu zögern im organisierten Kampf teilgenommen. Denn er "wollte sein Wissen nicht in den Dienst des Systems stellen". Er war sich darüber bewußt, daß der Kampf gegen den Faschismus organisiertes Revolutionärtum bedeutete. Bis zu seiner Gefangenschaft im Jahre 1994 hat er innerhalb von Dev-Genc unterschiedliche Aufgaben übernommen. Als Kämpfer der 1. Todesfastengruppe im Gefängnis von Ümraniye ist er in seinem langen Rennen, das er mit den Worten "Wir rufen die Stimme unserer Genossen, die aus den Gefängnissen den Aufrufen des Feindes!

'sich zu ergeben' mit 'Wir werden eher sterben, als uns ergeben' antworteten, noch lauter hinaus. Mit unserer Todesfastenoffensive werden wir diese Fahne ein weiteres Mal auf der Festung des Feindes aufpflanzen" begonnen hat, 343 Tage ohne Atempause gelaufen. Er setzte den Widerstand nach seiner Freilassung fort. Seine Gefühle in diesen Tagen hat er folgenderweise zum Ausdruck gebracht: "Heute befinde ich mich innerhalb der großen Familie der Partei-Front, meiner Familie. Ich bin glücklich und stolz. Ich bin gefüllt mit Begeisterung und Freude. Ich befinde mich unter Genossen. Ich bin in einer Gemeinschaft, selbstlos und ohne Rücksicht auf den Tod, ich liebe diese Familie." Diese Familie liebt auch Ihn.

AYSE BASTIMUR:

"Was kann schöner sein als sich der Gewalt zu widersetzen?"

Sie wurde am 24. Januar 1967 in Balikesir-Bigadic als Tochter einer Familie türkischer Herkunft und sunnitischen Glaubens geboren. Sie hat die Volks- und Mittelschule in Bigadic, das Gymnasium für den Medizinberuf in Balikesir abgeschlossen und als Krankenschwester zu arbeiten begonnen. Sie war in verschiedenen Krankenhäusern in Istanbul tätig.

Sie arbeitete in der Türkischen Krankenschwesternvereinigung. Ihre erste Bekanntschaft und Sympathie zu unserer Bewegung begann etwa im Jahre 1985. Ab 1987 nahm sie innerhalb unserer organisierten Zusammenhänge teil. Nach eigenen Worten hat sie das organisierte revolutionäre Leben gewählt "weil sie daran glaubte, die Wahrheit gefunden zu haben". Sie übernahm Aufgaben innerhalb der Organisation der Revolutionären Beamtenbewegung. Im Jahre 1988 wurde sie nach den 1. Mai Demonstrationen inhaftiert und verbrachte zweieinhalb Monate im Gefängnis von Bayrampasa. Nach ihrer Freilassung gab es schließlich eine Ayse die in ihrer Wahl für das Revolutionärtum noch klarer war. Bis zu ihrer Gefangennahme bei der Operation vom 16-17 April 1992 hat sie verschiedene spezielle Aufgaben in unserer Bewegung übernommen. Nach ihrer zweieinhalbjährigen Gefangenschaft in Bayrampasa wurde sie ins

Gefängnis von Canakkale verlegt. Als der Isolationszellen-Angriff an die Tagesordnung kam, nahm sie in der 1. Todesfastengruppe im Gefängnis von Canakkale teil. Während sie sich freiwillig meldete erklärte sie: "Was kann es schöneres geben als sich der Gewalt zu widersetzen?" Am 19. Dezember gehörte sie zu denen, die sich der Folter durch Zwangseingriff entgegenstellten. Sie hat die Bestechung durch Freilassung zurückgewiesen und das "rote Band", welches sie auch draußen um ihre Stirn band, nicht abgeworfen. Denn sie hat an den Sieg geglaubt und gewußt, daß das einzige Mittel gegen Unterdrückung der Widerstand war. Dies hat sie in ihren letzten Worten folgendermaßen zum Ausdruck gebracht:

"Wir haben den Weg beschritten um zu siegen. Die Entwicklungen haben einen noch viel stärkeren Willenskampf erfordert als wir erwartet hatten. Ob nun vorbereitet oder unvorbereitet, es war unsere Ehrenpflicht dies in Kauf zu nehmen. Niemand soll daran zweifeln, die Tage unseres Sieges sind ganz nah." Wenn sie auch den Sieg nicht erleben konnte, so sah sie ihn vorher und sagte: "Schon jetzt feiere ich den Sieg unseres Volkes und der Weltvölker".

DEVRYMCY HALK KURTULUP CEPHESY
REVOLUTIONÄRE VOLKSBEFREIUNGSFRONT

Datum: 10. Oktober 2001 Erklärung: 215

Schluß mit der Lüge und Demagogie!
Jede auf Afghanistan abgeworfene Bombe ist der Beweis der Realität!
DIES IST EIN EROBERUNGSKRIEG!

Nach tagelanger Propaganda, Manövern, und Demagogien hat sich die amerikanische Kriegsmaschinerie in Bewegung gesetzt und begonnen, das Volk von Afghanistan zu bombardieren.

Dabei war die Rede von Gerechtigkeit, unendlicher Freiheit und vom Anpassungskrieg; Alles gelogen. Mit diesen Diskussionen soll das Wesen des Angriffs verschleiert werden. Die USA bringen Tod und Hunger nach Asien. Die US-Operation ist ein offener, gegen die Weltvölker gerichteter Terrorangriff.

Dieser Krieg, ist der Krieg der USA um die Weltmacht. Es ist der Krieg um das Imperium.

Deshalb wird Afghanistan bombardiert. Deshalb werden Länder, Völker, Organisationen bedroht.

Schluß mit der Lüge und Demagogie!
Die USA Können Nicht Bestimmen, Wie Die Weltvölker Zu Leben Haben!
Die USA erklären 'Taliban wird dafür bezahlen, daß er nicht mit uns kollaboriert', und sagen damit ganz offen, wir werden dein Land in Schutt und Asche legen. Sie sagen 'Mir gefällt dein Regime nicht, ich werde es ändern'. Wo bleiben hier Demokratie, internationales Recht und Gerechtigkeit? Nichts davon ist zu sehen. Es ist absoluter Terror. Sie wechseln die Führungen: Um sie auszutauschen morden sie; die Überlebenden werden Armut und Hunger ausgesetzt, ohne ein Glas sauberes Wasser zu haben in Flüchtlingslager gesperrt. Wodurch wollen sie denn die Führung ersetzen, während sie mit Bomben und Raketen alles niederbrennen und massakrieren. Sie sagen "Hier habt ihr einen König!".

Die Realität: Jede Abgeworfene Bombe Dient Den Interessen Der Monopole. Das ist die imperialistische Demokratie. In der imperialistischen Demokratie gibt es keine Prinzipien; ihr einziges Prinzip sind die Interessen der Monopole. Hierfür verteidigt sie auch die Monarchie und führt Militärputsche durch. War es nicht sie selbst, die Taliban an die Regierung gebracht hat? Damals stellten die Lebensweise von Taliban und sein Regime kein Problem für Amerika dar. Denn die damaligen Interessen der Monopole lagen darin, die UdSSR-nahe Regierung in Afghanistan umzustürzen. Es war für die USA zu keiner Zeit bedeutend, ob der Charakter des Regimes in Afghanistan oder das eines anderen Landes demokratisch ist oder nicht; das entscheidende ist für die USA, ob es sich dem Amerikanischen Imperium beugt oder nicht. Wenn es sich beugt, ist es ein gutes, wenn nicht dann ist es ein schlechtes Regime, das ausgetauscht werden muß. Das Amerikanische Imperium

will den letzten Bissen des Volkes, die letzten Überreste der nationalen Willenskraft vernichten. Dies ist das Ziel des Eroberungskrieges. Sein Ziel ist; sich die ganze Welt untertänig zu machen.

Afghanistan Ist Die Tür Zur Eroberung Asiens

Die Hauptverantwortung für alle Gewalt auf der Welt trägt der US-Imperialismus, welcher der Welt sein Imperium aufzwingt. Er macht sich mit dem Vorwand Bin Ladin zu schnappen über die ganze Welt und die Völker lustig. Dies ist eine Operation zur Eroberung, mit der die Märkte Asiens und die Welt erbeutet werden sollen.

Das Imperium führt daran vorbei, den Mittleren Osten, den Balkan und Asien zu erobern. Der Angriff der mit Irak begann und mit Jugoslawien fortgesetzt wurde, richtet sich nun gegen Afghanistan. Weil dem so ist, haben die USA von Beginn an von einer langen Dauer dieses Krieges gesprochen; es ist wahrhaft nicht leicht, Asien und die Welt zu erobern. Der Asiatische Markt, der große Chinesische Markt, die ehemaligen Sowjetländer blenden die imperialistischen Monopole. Die Kriegsmaschinerie Amerikas hat sich in Bewegung gesetzt, um die Erdöllager in diesen Regionen zu beschlagnahmen. Dies ist der ganzen Welt bekannt. Schluß mit der Lüge und Demagogie. Der Angriff auf Afghanistan ist der größte und sichtbarste Zustand der imperialistischen Gewalt.

NATO, EU, UN Haben Sich An Amerika Festgeklammert!

Die USA haben damit begonnen, ihren Plan, Afghanistan zu bombardieren und sich von dort aus in ganz Asien auszubreiten in die Praxis umzusetzen. Die USA erklärten den anderen Imperialisten gegenüber, daß sie dies mit oder ohne ihre Beteiligung tun werden. Die EU hat sich beteiligt, um nicht ein Außensteher dieser Ausbeutung und Plünderung zu sein. So war dies schon beim Angriff auf Irak und Jugoslawien.

Die anderen Imperialisten besitzen weder die Kraft, dies zu verhindern noch die Vorreiterrolle zu übernehmen. Innerhalb dieses Kräftegleichgewichts, haben die USA NATO, EU und UN benutzt, um ihren Angriff zu legitimieren und die NATO den Beschluß fassen lassen, Artikel 5 in Anwendung zu bringen. Den Angriff führen sie im Grunde mit ihren eigenen Kräften durch.

Die Quelle Der Gewalt Ist Amerika Und Sein System.

Die gesamte Geschichte der USA ist gefüllt mit Massakern, Besetzungen, dunklen Geschäften, Attentaten, Komplotten. Sind nicht auch Taliban und Bin Laden, gegen die heute der Krieg geführt wird, jene Kräfte, die mit Unterstützung der USA ins Leben gerufen wurden?

Es sind die USA, die Militärputschs durchführen und Konterguerillaorganisationen aufbauen. Speziell für die Massaker und Militärjuntas, die vom 2. imperialistischen Verteilungskrieg bis in die Gegenwart verwirklicht wurden tragen die USA die Hauptverantwortung. Dieses System wurde für die Ausbeutung und Plünderung der Monopole aufgebaut. Die Bomben sind dessen offenste Erscheinung. Neben jenen, die durch Hunger und Armut getötet werden, stellen die durch Bomben Ermordeten nur einen geringen Anteil dar. Kapitalismus tötet durch Hunger. Dutzende von Institutionen veröffentlichen Statistiken. Die Weltvölker HUNGERN! Und wer läßt sie hungern?

Brot und Gerechtigkeit ist das Recht aller Völker. Wer dieses Recht raubt, ist auch verantwortlich für jede Form von Gewalt. Auf diese Weise wird Gewalt produziert. Den Kindern, die im Kugelhagel aufwachsen und den Völkern die inmitten von Bomben, Raketen und Hungersnot leben müssen, bleibt keine andere Wahl als für Brot und Gerechtigkeit Widerstand zu leisten und zu kämpfen.

Die Völker Besitzen Widerstandskraft Gegenüber Den Besetzern!

Auch die Völker, deren Brot und Gerechtigkeit geraubt werden sagen gegenüber diesem Zwang; 'wir entscheiden selbst, wie wir zu leben haben; auch wir haben das Recht zu regieren. Um dieses Recht in Anspruch zu nehmen, ist es auch unser legitimes Recht Widerstand zu leisten'.

Der Zorn der Weltvölker auf die USA ist nun noch größer geworden. Diese Wut wird sich in ganz unterschiedlichen Formen gegen die USA wenden.

Auch die Behauptung, die ganze Welt stünde auf der Seite der USA ist ein Teil der Demagogie. Es hat nicht allzugroße Bedeutung, ob so und so viele

=====
04 Wochentliche ATTAC-Info (41. Woche)
von: ATTAC Österreich, infos@attac-austria.org
=====

1. Erfolg der Aktionen zum Thema Steueroasen am 5. und 6. Oktober
2. 15.10. Attac Treffen Salzburg
3. 19.10. Terminerinnerung Reichtumskonferenz
4. 5.11. Gründung Attac Kärnten
5. 6.11. Start unseres monatlichen ForumAttac in Wien
6. 10.11. WTO Konferenz in Linz
7. 10.11. Ein Jahr ATTAC - Geburtstagsparty ebenfalls in Linz

1. STEUEROASE AKTION im Graben

War ein Erfolg! Nicht nur österreichische Medien waren interessiert, sondern auch internationale (z.B. Reuters). Fotos von unserer Steueroase könnt ihr nicht nur auf unserer Homepage <http://www.attac-austria.org/fotos/oase/oase.php> bewundern, sondern auch in verschiedenen Medien (z. B: Standard und Kurier vom 6.10, Profil 8. Oktober). Weiters gab es eine internationale Aktion in Luxemburg, viele AktivistInnen waren dort, die Infostände wurden gut besucht, Fotos unter www.attac.org/luxembourg.

Der Terror-Anschlag vom 11. September hat die Diskussion über Steueroasen und Geldwäsche ins Licht der Öffentlichkeit gerückt. So ist in der heutigen Ausgabe der Süddeutschen Zeitung ist das Thema des Tages "Konten sperren statt Krieg führen" und in der Einleitung ist zu lesen: ... "Terroristen nutzen offenbar oft dieselben Strukturen im internationalen Finanzsystem wie Geldwäscher. Sie eröffnen zum Beispiel Bankkonten von Scheinfirmen in Geldwäsche-Paradiesen, um Spuren zu verwischen. Die Arbeit der Ermittler wird in beiden Fällen durch die Existenz anonymer Konten erschwert.... Der ganze Text ist zu lesen auf: http://szonnet.diz-muenchen.de/REGIS_A13152257

2. Attac Treffen in Salzburg

Am 15. 10. um 18.30 ist im Salzburger Brunauerzentrum das erste Herbsttreffen. Dabei sollen die inhaltlichen Schwerpunkte festgelegt werden und über bereits konkret geplantes diskutiert werden. InteressentInnen kontaktieren Robert Müllner: auge.sbg@demut.at

Die Salzburger ATTAC-Gruppe ist Mitorganisatorin der Veranstaltungsreihe (9.11., 19.11., 7.12.) zum Thema: Seattle-Salzburg-Genua. Globalisierungsprotest und die Gewaltfrage des Salzburger Friedensbüros. Die erste prominent besetzte Veranstaltung findet am 9.11. um 18.00 h statt. Weitere Informationen folgen und sind in Kürze auf der Seite von ATTAC-Salzburg zu lesen.

3. Terminerinnerung: Reichtumskonferenz

Am 19./20. Oktober 2001 findet die Reichtumskonferenz mit einem spannenden Programm statt, ATTAC ist Mitorganisator. Das Programm findet ihr auf <http://www.attac-austria.org/termine/reichtumskonferenz.php>, Anmeldung und Infos bei: armutskonferenz@akis.at

4. Gründung von ATTAC - Kärnten

Am 5. November ist es auch in Kärnten soweit! ATTAC Kärnten wird gegründet. Und zwar im Rahmen einer Veranstaltung (u.a. mit Bischof Herwig Sturm "Die Welt- ein Casino? Ethische Problem unter dem Einfluss der Finanzmärkte") um 19.00 im Gemeindezentrum St.Ruprecht, in der St. Ruprechterstraße in Klagenfurt. Genauere Details werden nächste Woche bekanntgegeben.

InteressentInnen melden sich bei Walther Schütz: buendnis.oeie@aon.at

5. ForumAttac startet am 6. November

ForumAttac ist unser neuer, monatlicher Treffpunkt für ATTAC-Mitglieder und Interessierte und solche, die es noch werden wollen. Wirkliche statt virtuelle Kommunikation, Gemütlichkeit statt Aktionsstress, zum Kennenlernen für Interessierte; Informationen zu aktuellen Themen, Aktionen,...in Verbindung mit musikalischen Events (DJ, Jazz, Blues. Wer hat Ideen?) oder einfacher Beisl-Athmosphäre

6. November, 19.00 im Depot (Breite Gasse 3, 1070 Wien, hinter Museumsquartier);

Thema: Informationen zum Thema Welthandelsorganisation (WTO) anlaesslich der Ministerkonferenz in Qatar und der ATTAC-Konferenz in Linz.

Einleitungsstatement: Christian Felber, ATTAC Österreich

6. WTO KONFERENZ, 10. November Linz

In einem Monat ist es wieder soweit! Nach dem Scheitern der letzten WTO Konferenz in Seattle, findet diese Konferenz an einem Ort statt, wo es kein Demonstrationsrecht gibt! (Doha in Qatar vom 9-13. November). Zudem stehen auf der Agenda nicht nur die Bereiche Gesundheit, Bildung oder Wasserversorgung: Auf Initiative der EU-Kommission gelangt das Thema Investitionen auf die Tagesordnung, was voraussichtlich das berüchtigte Investitionsschutzabkommen MAI wiederbelebt. Nicht zuletzt deshalb finden in ganz Europa Kongresse, alternative Gipfel, Demonstrationen, Aktionen... statt, die eine andere Globalisierung fordern. Zudem werden diese Aktionen gegenüber den Medien von SOS-WTO-EU europaweit koordiniert.

Wir sind natürlich auch dabei: Mit dem Kongress zum Thema "Die Welt ist keine Ware - Qatar/Linz 2001" am 10. November in Linz (Volkshaus Dornach) den ganzen Tag ab 10.00 gemeinsam mit Greenpeace, Dreikönigsaktion, ÖGB Oberösterreich und anderen Organisationen.

Das Gesamtprogramm mit allen Infos wird am Montag getrennt ausgesandt und ist ab dann auch auf unserer Homepage. Wir freuen uns auf zahlreiche Teilnahme!

Im Anschluss an diese Veranstaltung findet am Abend

7. UNSERE GEBURTSTAGSFEIER

statt: ATTAC Österreich ist 1 Jahr alt geworden und beginnt dieses Fest mit einem Kabarett mit LEO LUKAS: "Herzlichen Glückwunsch"
Ab 22.00 geht's dann weiter mit einer Party mit der Hip-Hop Gruppe Die Schwerversprecher und Mc Semmel
Genaueres ebenfalls am Montag

Liebe Grüße
Euer ATTAC-Team

=====
05 Ende von ABC Luxembourg

Wirtschaft den vorgeformten Produktionsfaktor Mensch in die Hand zu spielen! Bildung ist Menschenrecht und keine Ware zum Verkauf!", so der AKS-Bundesvorsitzende.

Der 11. Oktober ist gleichzeitig der Startschuss der neuen AKS-Kampagne, die unter demselben Motto auf die Missstände in österreichs Schulen und den neo-konservativen Tenor von österreichs Bildungspolitik aufmerksam machen will. "Die gestrige Präsenz der SchülerInnen stellt einen großen Motivationsschub für unsere Arbeit dar. Wir werden weiterhin unserem Unmut Ausdruck verleihen - die Bildungsministerin kann die Anliegen der SchülerInnen nicht ewig ignorieren.", schließt Kowall.

Rückfragehinweis: Niki Kowall 0699/11408142

=====
07 Depot Programm in der Woche 15. bis 19.10.01
von: depot <koestring@depot.or.at>
=====

Sehr geehrte Damen und Herren, liebe FreundInnen und PartnerInnen des Depot,

in der Anlage finden Sie das Programm des Depot für die kommende Woche.

Wir freuen uns auf Ihr Kommen.

Ein wichtiger Hinweis: Die für Donnerstag, den 18. Oktober geplante Veranstaltung "Luxus - Ökonomie. Feministische Wirtschaftsmodelle" der feministischen Medien wurde leider abgesagt.

Depot-Team

Montag, 15. Oktober, 19.00
Bewegte Männer
Rosa Logar im Gespräch mit Erich Lehner und Stephan Schulmeister

Ist eine politische Umsetzung der Ziele des Feminismus nur möglich, wenn sie von Frauen vorangetrieben werden? Zum Auftakt einer Depot-Reihe über die Zukunft des Feminismus sitzen unter der Moderation von Rosa Logar zwei Männer auf dem Podium: Erich Lehner und Stephan Schulmeister sprechen über den Stellenwert des Feminismus aus dem Blickwinkel ihrer Disziplinen, über Formationen der Abschottung, über Innen- und Außensicht. Ist die Frauenbewegung mittlerweile eine gesellschaftliche Schutzzone geworden und wie funktionieren im Vergleich dazu Männervereinigungen?

Erich Lehner, Theologe, Männer- und Geschlechterforscher, Ludwig Boltzmann-Institut für Werteforschung, Wien.
Stephan Schulmeister, Österreichisches Institut für Wirtschaftsforschung (WIFO), Wien.
Rosa Logar, Geschäftsführerin der Interventionsstelle gegen Gewalt, Wien.

Dienstag, 16. Oktober, 19.00
Podiumsdiskussion
Elektronische Demokratie?

Unter welchen Bedingungen könnte Online Voting sinnvoll sein und zwar nicht nur, um die technische Durchführung demokratischer Wahlen zu vereinfachen, sondern auch, um die Demokratie zu stärken? Durch die Einbindung der User in Communities und Wahlbörsen könnte sich die Möglichkeit einer höheren Wahlbeteiligung ergeben, wenn der technological gap zwischen Usern und Non-Usern überwunden werden kann.

Die Aktion Vote-Auction (www.voteauction.at) der Gruppe übermorgen,

hat vor einem Jahr für die Wahlprozeduren in den USA eine "Vereinfachung" vorgeschlagen; eine Verbindung von Demokratie und Kapitalismus sollte direkt den WählerInnen zukommen.

Katharina Gsöllpointner, Kunst-, Kultur- und Medientheoretikerin, Wien.
lizvix und hans_extrem, KünstlerInnen der Gruppe übermorgen, Wien.
Gregor Matjan, Politikwissenschaftler, Institut für Politikwissenschaft der Universität Wien.

08 INTERFACE EXPLORER 18./19. Oktober 2001 -> 2nd Announcement
von: Martin Wassermair <wassermair@t0.or.at>
=====

|---
VERANSTALTUNGSANKÜNDIGUNG pt.2
Public Netbase Media~Space!
Institut für Neue Kulturtechnologien/t0

|---
| INTERFACE EXPLORER
| Shared Boundaries
|
<http://interface.t0.or.at/>
Ein Public Netbase Event im "Zwischenquartier" mit:
Markus Bader/DE, Jonah Brucker-Cohen/US, Matthew Fuller/UK,
Patricia Futterer/AT, Mieke Gerritzen/NL, Johannes Grenzfurthner/AT,
Graham Harwood/UK, Margarete Jahrmann/AT, Joes Koppers/NL , Christoph
Kummerer/AT, Pär Lannerö/SE, Lev Manovich/US/RU, Max Moswitzer/AT,
Peter Purgathofer/AT, Gebhard Sengmüller/AT, Stijn Slabbinck/BE

|---
18./19. Oktober 2001, jeweils ab 19 Uhr

Die Veranstaltung thematisiert den Umgang mit Interfaces (Deutsch: Verbindung, Schnittstelle, Zwischenstück) und versucht, ihre Vielseitigkeit im Zusammenhang mit neuen Informationstechnologien zu erklären. Dabei beschränkt sich der Blick nicht auf einen theoretischen Diskurs, sondern er sucht auch ganz bewusst einen spielerischen Zugang. Neben der Präsentation einer Reihe von PC- und Web-Interfaces werden auch Arbeiten von KünstlerInnen vorgestellt, die sich diesem Thema auf allgemeinere Art annähern und eigene sowie auch eigenwillige Umsetzungen erarbeiten.

Lev Manovich, ein bedeutender Theoretiker der Neuen Medien, beschreibt

in seinem aktuellen Buch "The Language of New Media" die kulturelle Dimension der digitalen Technologien und die Entwicklung der neuer Mensch/Maschine-Interfaces. Er wird im Rahmen seines Vortrags am 18. Oktober einige Grundlagen des kulturellen elektronischen Interfaces vorstellen und nicht nur Software-Kultur, sondern auch Kultur als Software begreifbar machen.

Am 19. Oktober folgt ein Panelgespräch zum Stand der Entwicklung kultureller Interfaces. ExpertInnen und EntwicklerInnen diskutieren dabei die gegenwärtig vorhandenen Ansätze im Interface Design. Mieke Gerritzen von NL.Design war eine der BegründerInnen des Internationalen Browserday, der vor 4 Jahren erstmals in Amsterdam und zuletzt in New York veranstaltet wurde, um Alternativen zu den bestehenden Web-Browsern aufzuzeigen. Zwei Gewinner der Browserday Awards - Joes Koppers (NL) und Jonah Brucker-Cohen (US) - werden ihre Projekte selbst vorstellen.

Die Künstler Harwood/Fuller beschäftigen sich seit langem mit den sozialen und sozio-kognitiven Aspekten der digitalen Informationsinteraktion. Sie präsentieren mit "TEXT-FM" ein text-to-speech-to-radio Projekt, bei dem über SMS anonyme Mitteilungen von einem Mobiltelefon gesendet werden und ein Computer einen über Sprache vermittelten Informationsaustausch ermöglicht.

Die Präsentationen und Installationen zeigen die Einbeziehung von Audio- und Videosystemen in das elektronische Interface - von Scratchrobot, TimeCodeVinyl, VinylVideo und Climax-Action Bot Concert bis hin zu webgesteuerter Discokugel-Musik und Musical Web-Pads.

| Ausstellung der INTERFACE EXPLORER Installationen bis Freitag,
| 9. November 2001 im Public Netbase Zwischenquartier
Geöffnet: Montag bis Freitag, von 14.00 bis 19.00 Uhr.

Eine neue Runde im Kosovo-Mythos

Slobodan Milosevic: Auf ewig im kollektiven Bewusstsein der Menschen
verankert
Ein Kommentar von Peter Jasow

Die bisherigen deutschen Kommentatoren der Auslieferung von Slobodan
Milosevic haben, soweit mir bekannt, nicht annähernd die Tragweite dessen
erfasst, was es für Serbien heißt, Milosevic ausgerechnet am
Vidovdan/Veitstag nach Den Haag auszuliefern. Damit hat Zoran Djindjic
bewiesen, dass er zu Recht den Beinamen "der Deutsche" trägt, denn wenn wir
den serbischen Maßstab heranziehen, heißt das: Slobodan Milosevic ist damit
ein Heiliger, dessen Name noch in tausend Jahren in einem Atemzug mit Milos
Obilic, Gavrilo Princip und Karadjordje Petrovic genannt werden wird. Zoran
Djindjics Name aber wird neben dem eines Vuk Brankovic für alle Zeit als mit
schwerster Schande bedeckt als Synonym für Verrat stehen.

- > President is at oil executive and the molders Secretary OF Defense. The
- > national Security Advisor is A director on the board OF A transnational
- > oil corporation and A Russia scholar. The Secretary OF State is A one with
- > NO diplomatic experience more whatsoever, and the molders Chair OF the joint
- > Chiefs OF Staff. The OTHER interesting appointment is Donald Rumsfeld as
- > Secretary OF Defense. Rumsfeld is the molders CEO OF Searle
- > Pharmaceuticals. He and Cheney were featured as speakers RK the May, 2000,
- > Russian American Business Leaders forum. So the consistent currents in
- > this acres petroleum, the molders Soviet union, and the cabinet military.
- > Based on the records OF Daddy Bush, into all his guises, and the general
- > trajectory OF US foreign policy as far bake as the Carter administration,
- > I feel I CAN reasonably conclude that Middle Eastern and South Asian
- > fossil fuels acres one OF their major preoccupations. Emergency just because this
- > klavern has some very direct financial interests in fossil fuel, but
- > because they surely know that worldwide oil production is peaking as incoming goods
- > speak, and wants soon begin A permanently and precipitous decline that wants
- > completely CHANGE the characters OF civilization as incoming goods know it within 20
- > years. Even the left seems ton in deep denial about this, but the math
- > is available. And, NO, alternative energies and energy technologies wants
- > emergency save US. All the alternative into the world CAN emergency begin ton provide
- > more than A tiny fraction OF the energy cousin now provided by oil. This
- > makes it more than A resource, and the drive ton control what's left more
- > than on economic competition.
- > I conclude that the economic colonization OF the molders Soviet
- > union is probably high on that agenda, and in fact has A powerful synergy
- > with the issue OF petroleum. Russia emergency only holds vast untapped resources
- > that beckon ton imperialism in crisis, it remains A credible military and
- > nuclear more challenger into the region.
- > incoming goods have emergency one, but three members OF the Bush in fact cabinet with

> military credentials, which makes the cabinet look quite A plumb bob like A
> military general Staff. All this way before Septembers 11th.
> Then there's the subject OF the North Atlantic Treaty Organization. NATO
> have expected consignment ton the dustbin OF the Cold might was after the
> Eastern Bloc shattered in 1991. Peace dividend and all that. But it
> didn't. It expanded directly into the molders of states OF the Eastern Bloc
> toward the molders Soviet union, and contributed forces ton the significant
> devastation OF Iraq A key country into the world oil market, more over which
> control of translates into the ability ton manipulate oil of prices.
> NATO is A military formation, and the United States exerts the controlling
> interest in it. It seemed like A form without A function, but it remedied
> that pretty quickly.
> Then when Yugoslavia refused tons play ball with the internationally Monetary
> find, the US and Germany began A systematic campaign OF destabilization
> there, even using some OF the of veteran OF Afghanistan in that campaign.
> NATO became the military OF that poor agenda the BREAK UP OF Yugoslavia
> into compliant statelets, the containment OF the molders Soviet
> union, and the future pipeline easement for Caspian Sea oil ton of Western
> European markets through Kosovo.
> You lake, this is important tons and-purchased, and people even those against
> the was it talc acres tending tons overlook the significance OF. NATO is emergency A
> guarantor OF internationally law, and it is emergency A humanitarian organization.
> It is A military alliance with one very dominant partners. And it CAN NO
> more longer claim ton A defensive alliance against European socialists. It is
> at instrument OF military aggression.
> NATO is the organization that is now going tons thrust along the
> 40th parallel from the of the Balkans through the Southern Asian Republics OF the
> molder Soviet union. The US military has already taken control OF A cousin
> in Uzbekistan. NO one is talking about how what incoming goods of acres doing seems tons A
> very logical extension OF A strategy that which already in motion, and has
> been into motion for two decades. Once incoming goods recognize the pattern OF activity
> designed tons simultaneously consolidate control of over Middle Eastern and
> South Asian oil, and contain and colonize the molders Soviet union,
> Afghanistan is exactly where they need tons go ton pursue that agenda.
> Afghanistan borders Iran, India, and even China but, more importantly, the
> Central Asian Republics of the former Soviet Union, Uzbekistan,
> Turkmenistan and Tajikistan. These border Kazakhstan. Kazakhstan borders
> Russia. Turkmenistan sits on the Southeastern quadrant of the Caspian Sea,
> whose oil the Bush Administration dearly covets.
> Afghanistan is necessary for two things: as a base of operations to begin
> the process of destabilizing, breaking off, and establishing control over
> the South Asian Republics, which will begin within the next 18-24 months
> in my opinion, and constructing a pipeline through Turkmenistan,
> Afghanistan, and Pakistan to deliver petroleum to the Asian market.
> The BBC was recently told by Niaz Naik, a Pakistani Foreign Secretary,
> that senior American officials were warning them as early as mid-July that
> military action for mid-October was being planned for Afghanistan. In
> 1996, the Department of Energy was issuing reports on the desirability of
> a pipeline through Afghanistan, and in 1998, Unocal testified before the
> House Subcommittee on Asia and the Pacific that this pipeline was crucial
> to transport Caspian Basin oil to the Indian Ocean.
> Given this evidence that a military operation to secure at least a portion
> of Afghanistan has been on the table, possibly as early as five years ago,
> I can't help but conclude that the actions we are seeing put into motion
> now are part of a pre-September 11th agenda. I'm absolutely sure of that,
> in fact. The planning alone for operations, of this scale, that are now
> taking shape, would take many months. And we are seeing them take shape in
> mere weeks.
> It defies common sense. This administration is lying about this whole
> thing being a "reaction" to September 11th. That leads me, in short order,
> to be very suspicious of their yet-to-be-provided evidence that someone in
> Afghanistan is responsible. It's just too damn convenient. Which also
> leads me to wonder-just for the sake of knowing-what actually did happen
> on September 11th, and who actually is responsible.
> The so-called evidence is a farce. The US presented Tony Blair's puppet
> government with the evidence, and of the 70 so-called points of evidence,
> only nine even referred to the attacks on the World Trade Center, and

>those points were conjectural. This is a bullshit story from beginning to
>end. Presented with the available facts, any 16-year old with a liking for
>courtroom dramas could tear this story apart like a two-dollar shirt. But
>our corporate press regurgitates it uncritically. But then, as we should
>know by now, their role is to legitimize.

>This cartoon heavy they've turned bin Laden into makes no sense, when you
>begin to appreciate the complexity and synchronicity of the attacks. As a
>former military person who's been involved in the development of countless
>operations orders over the years, I can tell you that this was a very
>sophisticated and costly enterprise that would have left what we call a
>huge "signature".

>In other words, it would be very hard to effectively conceal.

>So there's a real question about why there was no warning of this. That
>can be a question about the efficacy of the government's intelligence
>apparatus. That can be a question about various policies in the various
>agencies that had to be duped to orchestrate this action. And it can also
>be a question about whether or not there was foreknowledge of the event,
>and that foreknowledge is being covered up. To dismiss this concern out of
>hand as the rantings of conspiracy nuts is premature. And there is a
>history of this kind of thing being done by national political bosses,
>including the darling of liberals, Franklin Roosevelt. The evidence is
>very compelling that the Roosevelt Administration deliberately failed to
>act to stop Pearl Harbor in order to mobilize enough national anger to
>enter the World War II.

>I have no idea why people aren't asking some very specific questions about
>the actions of Bush and company on the day of the attacks.

>Follow along:

>Four planes get hijacked and deviate from their flight plans, all the
>while on FAA radar. The planes are all hijacked between 7:45 and 8:10 AM
>Eastern Daylight Time.

>Who is notified?

>This is an event already that is unprecedented. But the President is not
>notified and going to a Florida elementary school to hear children read.

>By around 8:15 AM, it should be very apparent that something is terribly
>wrong. The President is glad-handing teachers.

>By 8:45, when American Airlines Flight 11 crashes into the World Trade
>Center, Bush is settling in with children for his photo ops at Booker
>Elementary. Four planes have obviously been hijacked simultaneously, an
>event never before seen in history, and one has just dived into the worlds
>best know twin towers, and still no one notifies the nominal Commander in
>Chief.

>No one has apparently scrambled any Air Force interceptors either.

>At 9:03, United Flight 175 crashes into the remaining World Trade Center
>building. At 9:05, Andrew Card, the Presidential Chief of Staff whispers
>to George W. Bush. Bush "briefly turns somber" according to reporters.

>Does he cancel the school visit and convene an emergency meeting? No.

>He resumes listening to second graders read about a little girl's pet
>fucking goat, and continues this banality even as American Airlines Flight
>77 conducts an unscheduled point turn over Ohio and heads in the direction
>of Washington DC.

>Has he instructed Chief of Staff Card to scramble the Air Force? No.

>An excruciating 25 minutes later, he finally deigns to give a public
>statement telling the United States what they already have figured out;
>that there's been an attack by hijacked planes on the World Trade Center.

>There's a hijacked plane bee-lining to Washington, but has the Air Force
>been scrambled to defend anything yet? No.

>At 9:30, when he makes his announcement, American Flight 77 is still ten
>minutes from its target, the Pentagon.

>The Administration will later claim they had no way of knowing that the
>Pentagon might be a target, and that they thought Flight 77 was headed to
>the White House, but the fact is that the plane has already flown South
>and past the White House no-fly zone, and is in fact tearing through the
>sky at over 400 nauts.

>At 9:35, this plane conducts another turn, 360 degrees over the Pentagon,
>all the while being tracked by radar, and the Pentagon is not evacuated,
>and there are still no fast-movers from the Air Force in the sky over
>Alexandria and DC.

>Now, the real kicker: A pilot they want us to believe was trained at a
>Florida puddle-jumper school for Piper Cubs and Cessnas, conducts a
>well-controlled downward spiral, descending the last 7,000 feet in
>two-and-a-half minutes, brings the plane in so low and flat that it clips
>the electrical wires across the street from the Pentagon, and flies it
>with pinpoint accuracy into the side of this building at 460 nauts.
>When the theory about learning to fly this well at the puddle-jumper
>school began to lose ground, it was added that they received further
>training on a flight simulator.
>This is like saying you prepared your teenager for her first drive on I-40
>at rush hour by buying her a video driving game. It's horse shit!
>There is a story being constructed about these events. My crystal ball is
>not working today, so I can't say why.
>But at the least, this so-called Commander-in-Chief and his staff that we
>are all supposed to follow blindly into some ill-defined war on terrorism
>is criminally negligent or unspeakably stupid. And at the worst, if more
>is known or was known, and there is an effort to conceal the facts, there
>is a criminal conspiracy going on.
>Certainly, the Bush de facto administration was facing a confluence of
>crises from which they were temporarily rescued by this event. Whether
>they played a sinister role or not, there is little doubt that they have
>at the very least opportunistically pounced on this attack to overcome
>their lack of legitimacy, to shift the blame for the encroaching recession
>from capitalism to the September 11th terror attack, to legitimize their
>pre-existing foreign policy agenda, and to establish and consolidate
>repressive measures domestically and silence dissent. In many ways,
>September 11th pulled the Bush cookies out of the fire.
>And given them the green light to begin constructing a long-term scenario
>within which to establish fascistic control measures at home and abroad as
>a citadel for the ruling class in the catastrophic conjuncture that we are
>entering based on the end of oil.
>This elephant in the living room is being studiously ignored. In fact, the
>domestic repression has already begun, officially and unofficially. It's
>kind of a latter day McCarthyism. I participated in a teach-in at Chapel
>Hill, North Carolina, on the 17th of September, and though not a single
>person on the panel excused or justified the attacks, and every person
>there offered either condolences and prayers for the victims, we were
>excoriated within two days as "enemies of America." Yesterday an op-ed
>called for my deportation (to where, one can only guess). Now Herr
>Ashcroft is fast tracking the biggest abrogation of US civil liberties
>since the so-called anti-terrorism legislation after the Oklahoma City
>bombing - which by the way hasn't resulted in anti-terrorism but in the
>acceleration of the application of the racist death penalty. The FBI has
>defined terrorist groups not by whether any given group has ever acted as
>terrorists, but by their beliefs. Some socialists and anti-globalization
>groups have already been identified by name as terrorist groups, even
>though there is not a single shred of evidence that they have ever
>participated in any criminal activity. It reminds me of the Smith Act that
>was finally declared unconstitutional, but only after a hell of a lot of
>people served a hell of a long time in jail for the crime of thinking.
>I think this also points to yet another huge problems that the Bush regime
>was facing. Worldwide resistance to the whole so-called neoliberal agenda,
>which is a prettied up term for debt-leverage imperialism. While debt and
>the threat of sanctions has been used to coerce nations in the periphery,
>we have to understand that the final guarantor of compliance remains
>military action. For a global economic agenda, there is always a
>corresponding political and military agenda.
>The focal point of these actions in the short term is Southern Asia, but
>they have already scripted this as a worldwide and protracted fight
>against terrorism.
>It's far better than drug wars as a rationalization, and the drug war
>thing was being discredited in any case. Leftists are regaining power and
>popularity in Venezuela, El Salvador, Nicaragua, Ecuador, Colombia, the
>Dominican Republic, Haiti, Brazil, and Argentina. Cuba has gained immense
>prestige over the last few years. The empire is beginning to unravel. We
>can hardly justify intervention in these places by saying they are not
>towing the economic line by allowing the absolute domination of their

>societies by transnational corporations. That exposes the agenda. So we
>simply claim they are supporting terrorism.
>It's for all these reasons I say the left has missed the boat on this one,
>by allowing them to get away with rushing past the question of who did
>what on September 11th. If the official story is a lie, and I think the
>circumstantial case is strong enough to stay with this question, then we
>really do need to know what happened. And we need to understand concretely
>what the motives of this administration are.
>And we need to understand more than just their immediate motives, but
>where the larger social forces that underwrite our situation right now are
>headed. I do not think this administration is engaged in the deliberative
>process of a political grouping that is on top of their game. They are
>putting together some very deliberative technical solutions in response to
>a larger situation that it slipping rapidly out of their control. Like
>clear cutting. There's a very smart technology being employed to do a very
>dumb thing.
>What they are responding to is not September 11th, but the beginning of a
>permanent and precipitous decline in worldwide oil production, the
>beginning of a deep and protracted worldwide recession, and the unraveling
>of the empire.
>This brings me to a point about what all this means for Americans'
>security, which they are perfectly justified to worry about. The actions
>being prepared by this administration will not only not enhance our
>security, it will significantly degrade it. Military action against many
>groups across the globe, which is what the administration is telling us
>quite openly they are planning to do, will put a lot of backs against the
>wall. That can't be very secure.
>The concept of war being touted here is a violation of the principles of
>war on several counts, and will inevitably lead to military catastrophes,
>if you're inclined to view this from a position of moral and political
>neutrality.
>And the people who are now in possession of half the world's remaining oil
>reserves are subject to destabilization for which we can't even pretend to
>predict the consequences-but loss of access to critical energy supplies is
>certainly within the realm of possibility. Worst of all, we will be
>destabilizing Pakistan, a nuclear power in an active conflict with its
>neighbor, and we will be provoking Russia, another nuclear power. The
>security stakes don't get any higher, and Americans can ill afford to
>ignore nukes.
>And I think that this domestic agenda is a tremendous threat to the
>security of anyone who is critical of the government or their corporate
>financiers, and we already know that the real threats are against
>populations that can easily be scapegoated as the domestic crisis deepens.
>There is a very real threat right now of creeping fascism in this country,
>and that phenomenon requires its domestic enemies. Historically those
>enemies have included leftists, trade unionists, and racially and
>nationally oppressed sectors. This whole "state of emergency" mentality is
>already being used to quiet the public discourses of anti-racism, of
>feminism, of environmentalism, and of both socialism and anarchism. And
>while there is token resistance by officials to anti-Muslim xenophobia,
>the stereotypical images have saturated the media, and the government is
>already beginning to openly re-instate racial profiling. It is only a
>short step from there to go after other groups. We have long been prepared
>by the ideologies of overt and covert racism, and racism as both
>institution and corresponding psychology in the United States is nearly
>intractable.
>It's for all these reasons that I say emphatically that we can not accept
>anything from this administration; not their policies nor their bullshit
>stories. What they are doing is very, very dangerous, and the time to
>fight back against them, openly, is right now, before they can consolidate
>their power and their agenda. Once they have done that, our job becomes
>much more difficult.
>The left, if it has the capacity to self-organize out of its oblivion,
>needs to understand its critical roles here. We have to play the role of
>credible, hard-working, and non-sectarian partners in a broader
>peace-movement. We have to study, synthesize, and describe our current
>historical conjuncture. And we have to prepare leadership for the decisive

>conflict that will emerge to first defeat fascism then take political power.

>Rosa Luxemburg's words are truer than ever right now. We are not faced
>with a choice between socialism and capitalism, but socialism or barbarism.
>And what we can least afford are denial and timidity.

02 4 Gefallene Im Großen Widerstand
von: Revolutionäre Volksbefreiungsfront <press@dhkc.org>
=====

4 Gefallene Im Großen Widerstand
Unsere, Mit 72 Gefallenen Größer werdende Rechnung
Der Widerstand Jener, Die Sich Für Eine Unabhängige Türkei Anstelle Von Der
Amerikanischen Regierung Aussprechen
Der Marsch Der Patrioten Gegen Die Landesverräter

DIE PATRIOTEN DIE SICH IM WIDERSTAND FÜR BROT UND GERECHTIGKEIT BEFINDEN
WERDEN SIEGEN

Zeynep Arıkan Gülbag, die genau 343 Tage lang die Worte "Für unser Volk, das bisher kein Glück erfahren konnte..." auf ihrem Stirnband trug, hat sich am 27. September in Armutlu zu den Helden unseres unbesiegbaren Volkes begeben. Ali Rıza Demir ist auf seinem Marsch, den er am 20. Oktober 2000 mit den Worten "Wir werden die Volksfeinde, Imperialisten und ihre Kollaborateure daran hindern, unser Volk auszubeuten und unser Land Stück für Stück zu verkaufen" angetreten hat, am 27. September, den 343. Tag des Widerstands in Armutlu unsterblich geworden.

Ayşe Bastımur krönte ihren Kampf, den sie opferbereit mit den Worten "Wir werden auf den Böden unseres Landes Welle für Welle zur Freiheitshoffnung werden" aufnahm, am 28. September, den 342. Tag ihres Widerstands in Ankara mit ihrem Martyrertum.

Özlem Durakcan ist in ihrem Widerstand, den sie vor 74 Tagen mit den Worten "Ich bin gegen Ungleichheit, Ausbeutung, Ungerechtigkeit, ich will ein Land in dem man menschlich leben kann" begonnen hat, am 28. September in Ankara gefallen.

Die Karawane zieht mit 4 Gefallenen in zwei Tagen weiter. Der Kampf gegen die Tyrannei der Pro-Amerikaner setzt sich gnadenlos fort.

Zeynep, Ali Rıza und Ayşe... Sie sind KämpferInnen der 1. Todesfastengruppe, unsere drei Helden und Herzen, die Massaker, Unterdrückung, Folter, Bestechung und Zeit nicht von ihrem Weg abbringen konnten.

Özlem... das junge Herz der Verantwortung, eine junge Anhängerin des TAYAD, die ihr Leben denen gewidmet hat, die sich der Unterdrückung widersetzen.

Zeynep, Ali Rıza und Ayşe waren WiderstandskämpferInnen der 1. Todesfastengruppe. Sie wurden freigelassen. Sie haben nicht einmal für einen Moment an Verrat gedacht. Sie haben nicht gezögert. Sie haben auf das Gesicht des Verrats gespuckt, der über unsere Leichen gehend zum Vorschein trat, und ihren Weg fortgesetzt. Drei Fäuste prallten eine nach dem anderen auf das Gesicht des Verrats aus dem alles Leben gewichen ist.

Mit 4 Rosen haben wir die Brust der Unterdrückung mitsamt ihrer Kugel geschlagen. Während unser in einem Atemzug fortgesetzter Widerstand bald 1 Jahr vollendet hat, ist aus unseren Gefallenen mittlerweile ein Berg entstanden. Wir haben genau 72 Leben gegeben in diesem Kampf. Wir sind 72 Mal gestorben, seitdem die Oligarchie gegen das Volk der Türkei einen Krieg eröffnet hat.

In diesen 344 Tagen sind wir genau 72 Mal gestorben, aber die Hand des Widerstands hat nicht ein einziges Mal gezittert. Nicht ein einziges Mal konnten sie in die Knie gezwungen werden.

Die Geschichte ist nicht müde geworden, weiterhin unsere Heldenepen niederzuschreiben. Anatolien wurde durch unseren Schrei der Rebellion, der sich gegen die Tyrannei von seinen Böden erhebt, geehrt. Es hat die Namen unserer Helden mit rotem Stirnband an der Seite der würdevollsten Kinder einer tausende Jahre existierenden Menschheitsgeschichte verewigt.

DIE REGIERUNG MUSS VON IHRER ILLUSION UND IHREN LÜGEN ABWEICHEN

Den Krieg, den Amerika zur Stabilisierung seines Imperiums mit der Lüge "gegen den Terror" begonnen hat als Gelegenheit nutzend, hat sich die Oligarchie noch intensiver an Lügen wie "Das Todesfasten wird vom Ausland gelenkt" geklammert, um ihren mörderhaften Charakter legitim zu zeigen.. Wie bedauernswert.

Was gestern die lügnerischen Minister und Regierungen gesagt haben, wird heute schamlos und ungeniert vom heuchlerischen General Yasar Büyükanit nachgeplaudert.

Wir verkünden der ganzen Welt ein weiteres Mal; ihr sucht die Führungszentrale des Widerstands?

Das Zentrum des Widerstands, sein Stützpunkt, die ihn Leitenden und Ausführenden sind unsere Menschen, die den Tod in Kauf genommen haben. Ihr könnt mit Euren Lügen nicht den Widerstand brechen, sondern Euch damit lediglich vor der ganzen Welt lächerlich machen.

Die Gefangenen haben dies mit den Worten "Selbst wenn ein Einziger von uns zurückbleibt, wird der Widerstand andauern" erklärt.

Es ist eine Illusion, auf das Ende des Widerstands zu warten, ohne daß die Forderungen erfüllt wurden.

Es ist eine Illusion zu erwarten, daß uns Zeit, Unterdrückung und Tod einschüchtern.

Gebt diese Illusion auf. Akzeptiert die Forderungen der Gefangenen ehe ihr eure Schuld und die Wut vergrößert.

Stoppt die Isolation.

Die 7. Todesfastengruppen, die am 26. September den Widerstand begonnen haben, sind der Beweis für die Entschlossenheit und dafür, wie brennend und unverzichtbar die Forderungen sind.

Allein die 4 Helden, die innerhalb von zwei Tagen gefallen sind, geben den besten Beweis dafür ab, daß der Widerstand einen großen Preis in Kauf nimmt.

Jene, die immer noch darauf warten, daß der Widerstand von selbst endet, sind entweder schwer von Begriff oder leben nicht in diesem Land.

WIR LEISTEN WIDERSTAND GEGEN DIE TYRANNEI DER PRO-AMERIKANISCHEN REGIERUNG

Diese Regierung hat weder mit dem Volk noch mit dem Land irgendetwas zu tun.

Das Volk ist hungig, arm, arbeitslos, mit Ausnahme einer Handvoll

Kollaborateure will niemand die Böden unseres Landes an das Amerikanische Imperium verschenken. Das Land ist zur Hölle geworden, aber das kümmert die Regierung überhaupt nicht.

Sie sagen "Volle Unterstützung an Amerika" und nichts weiter.

DIESE REGIERUNG EXISTIERT LEDIGLICH FÜR DIE INTERESSEN DES AMERIKANISCHEN IMPERIUMS.

Sie haben die Führung des Landes den Konsulen der USA und dem IMF ausgehändigt.

Der amerikanische Außenminister klatscht in die Hände und sie begeben sich Hals über Kopf in die USA. Sie sagen "Wir stehen bedingungslos in Eurem Befehl".

Das arme Volk des in einen Feuerherd verwandelten Anatoliens ruft "WIR SIND HUNGRIG", doch sie drehen sich nicht einmal nach ihm um.

Die Knechtschaft hat eine derartige Dimension angenommen, Bush spricht von "Kreuzzügen" und diese Regierung korrigiert ihn "es handelt sich um ein Mißverständnis". Die ganze Welt kritisiert Bush, aber diese Regierung gibt kein Wort von sich.

Diese Regierung sagt nur: "Völlige Unterstützung an Amerika". Diese Regierung will unser Land zu einem Bundesland Amerika's machen!

WIR WERDEN DIES NIEMALS ZULASSEN!

Kann das Amerikanische Imperium ein Volk, aus dem 4 Helden im gleichen Zeitraum wie ein Messer auf die Brust der Unterdrückung einstechen, zu seinem Untertanen machen?

Solange dieses Volk Helden wie diese hervorbringt, sich Hunderte von Freiheitskämpfern für Brot und Gerechtigkeit mit Aufopferungsgeist schmücken; können jene, die eine Operation zur Eroberung der Welt beginnen und sagen, daß Systeme, die auf Egoismus, Profit, Lügen, Plünderung, Raub, Ausbeutung und Massaker aufgebaut sind "die überlegenste Zivilisation sind", sowie deren Kollaborateure in unserem Land das Volk nicht zur Ergebung zwingen.

Unser Widerstand ist der Widerstand des nicht kapitulierenden Volkes.

Unser Widerstand ist der Widerstand der Patrioten gegen den Landesverrat.

Unser Widerstand ist das unzerbrechliche Monument der Losung "Unabhängige

Türkei" gegen die pro-amerikanische Regierung. Unser Widerstand ist gegen das Unterdrückungs- und Ungerechtigkeitssystem des US-Imperiums und seiner Kollaborateure, die einen Krieg ansagen, um auf der Welt keine einzige oppositionelle Kraft übrigzulassen. Als die Oligarchie zusammen mit dem IMF dem Volk den Krieg erklärt und als wichtigen Teil dessen die F Typ Gefängnisse an die Tagesordnung gebracht hat, stellten wir ihr unseren Widerstand entgegen; heute, wo Amerika allen unterdrückten Völkern der Welt den Krieg erklärt, geben wir unsere Antwort im Widerstand.

Wir verkünden der ganzen Welt, daß der Pro-Amerikanismus auf diesem Boden keine Ruhe finden wird. Unser Todesfastenwiderstand ist ein prunkvolles Manifest aller dem Volk angehörenden Werte gegenüber der pro-amerikanischen Kultur. Genau dann, wenn die Pro-Amerikaner denken, daß sie alle Gehirne mit der amerikanischen Kultur beschmutzen konnten; explodieren wir wie ein Vulkan, aus dessen Lava Geschwisterlichkeit, Solidarität, gegenseitige Unterstützung, Genossenschaftlichkeit, Opferbereitschaft, Liebe zum Volke und zur Heimat sprüht. Wir zerschmettern und verwischen den Schmutz des Egoismus, der Fäulnis und der Unmoral in ihren Köpfen.

DER KAMPF IST EIN KAMPF UM BROT

DIE FORDERUNG UNSERES VOLKES IST BROT UND GERECHTIGKEIT

Das amerikanische Imperium läßt die Weltvölker ohne Brot und Gerechtigkeit. Die Oligarchie der Türkei läßt ihr Volk ohne Brot und Gerechtigkeit. Diese Regierung bringt lediglich Unterdrückung und Hunger. Unser Volk wurde so weit gebracht, daß es heute nicht mehr imstande ist das trockene Brot, welches es gestern gegessen hat, zu kaufen.

Wie lange kann dieser Hunger, diese Ungerechtigkeit noch mit Tyrannei unterdrückt werden? Wie lange noch können sie die Rebellion der Hungernden und Verarmten mit Polizei und Armee aufhalten? Unser Volk muß sich sättigen. Es gibt keine einzige Kraft in der Welt, die eine solche Forderung unterdrücken kann.

GESCHWISTER! UNSER HUNGRIGES UND ARMES VOLK!

Wir müssen uns gegen das Unterdrückungssystem, welches von der Hilfsregierung des IMF aufgebaut wurde, organisieren. Wir müssen uns für Brot organisieren. Wir müssen uns für Gerechtigkeit organisieren. Wir können nicht ohne Brot und Gerechtigkeit leben.

Die 4 Gefallenen sind ein Aufruf zur Rebellion gegen den IMF, das US-Imperium und die pro-amerikanische Regierung.

Sie sind der Aufruf für ein Land, das nicht vom IMF regiert wird. Wenn wir Brot wollen, dann müssen wir uns vom IMF und seinen Kollaborateuren befreien.

Unser Widerstand ist der Aufruf für ein freies und unabhängiges System, in dem unser Volk in Satttheit lebt.

Wir werden dieses von unseren Gefallenen ersehnte System aufbauen.

UNSERE GEFALLENEN:

Zeynep ARIKAN GÜLBAG:

"Dieses Leben soll ihnen gewidmet sein!"

Im Jahre 1986 lernte sie Anhänger der Dev-Genc kennen. Sie machte einen Schritt vor in den Kampf. Unsere Genossin Zeynep befindet sich heute wie gestern im Kampf. Heute, sowie gestern hat sie auf vielen Gebieten des Kampfes Aufgaben übernommen. Sie war Führerin, Kommandantin. Am Vorabend des letzten großen Gefechts erklärte sie "Ich möchte nicht am Kampf teilnehmen sondern im Kampf ganz vorne stehen", und das ist ihr gelungen. Mit einer Bescheidenheit, die sagt "Ich versuche am 280. Tage des Todesfastens lediglich ein einfacher Soldat des Kampfes zu sein", ist sie als

Kommandantin und Symbol der Herausforderung von Zeit und Unterdrückung, der Willensstärke und Entschlossenheit unsterblich geworden. Unsere Genossin Zeynep wurde 1968 in Malatya Hekimhan geboren. Im Kindesalter ist sie mit ihrer Familie nach Istanbul verzogen. Zwischen 1986-87 lernte sie in der Universität zu Istanbul die Anhänger der Dev-Genc kennen. Und sie hat ihren Kampf von 1987 bis 1992 innerhalb von Dev-!

Genc geführt. Während dieser Zeitspanne ist sie mehrmals festgenommen worden. Sie wurde aufgrund eines Protests gegen das Massaker in Maras festgenommen und befand sich für eine Weile im Gefängnis von Bayrampasa. Sie übernahm Aufgaben innerhalb des Dev-Genc- Komitees. Sie arbeitete bei der

Zeitung Mucadele. Mit Kazim Gülbag heiratete sie im März 1992. Die Bedingungen des Kampfes und die organisatorischen Bedürfnisse haben sie nach kurzer Zeit voneinander getrennt. Während sich Zeynep im Gefängnis von Ümraniye im Todesfasten befand, war Kazim Gülbag im Ausland. Er beteiligte sich am Widerstand, indem er seinen Körper in Brand steckte; Er hat seine Verbundenheit und Liebe zu seinen Genossen, seinem Volk und seiner Ehefrau gezeigt, indem er seinen Körper gegen die Unterdrückung einsetzte. Im Jahre 1993 wurde Zeynep seitens der Putschisten angeschossen. Zwischen 1995-96 befand sie sich zwecks Ausbildung auf verschiedenen Gebieten. Von 1996-1997 übernahm sie die Aufgabe als Kommando!

ndantin innerhalb der Bewaffneten Propagandaeinheiten in Istanbul. Sie setzte ihre Unterschrift unter Aktionen, bei denen die Volksjustiz gegen Folterer und Mörder umgesetzt wurde. Am 4. August 1997 wurde sie festgenommen und ins Gefängnis gesteckt. Als die Gefängnisse des Typ F an die Tagesordnung kamen, befand sie sich im Gefängnis von Ümraniye. Sie trat ins Todesfasten. Der 19. Dezember, die Folter Zwangsernährung, Bestechung der Freilassung folgten eine nach dem anderen. Sie liebte ihr Volk, war ihren Genossen verbunden und ihren Gefallenen treu. Sie hat nicht gezögert. Sie wurde unsterblich mit dem Glauben an den Sieg.

ALI RIZA DEMIR:

"Ich bin in einer Gemeinschaft, selbstlos und ohne Rücksicht auf den Tod"
Er wurde am 9. November 1973 als Kind einer armen Kurdischen Familie in dem Dorf Adiyaman-Gökçay (Karikan) geboren. Er kannte die Repression und die Unterdrückung aus seinem Dorf. Er war das Kind eines Volkes, dessen Sprache und Kultur verboten war. Nach Abschluß des Gymnasiums in Malatya trat er im Jahre 1991 das Fach Textilingenieurwesen an der Technischen Universität zu Istanbul an. Hier lernte er die Anhänger von Dev-Genc kennen. Er hat ohne zu zögern im organisierten Kampf teilgenommen. Denn er "wollte sein Wissen nicht in den Dienst des Systems stellen". Er war sich darüber bewußt, daß der Kampf gegen den Faschismus organisiertes Revolutionärtum bedeutete. Bis zu seiner Gefangenschaft im Jahre 1994 hat er innerhalb von Dev-Genc unterschiedliche Aufgaben übernommen. Als Kämpfer der 1. Todesfastengruppe im Gefängnis von Ümraniye ist er in seinem langen Rennen, das er mit den Worten "Wir rufen die Stimme unserer Genossen, die aus den Gefängnissen den Aufrufen des Feindes!

'sich zu ergeben' mit 'Wir werden eher sterben, als uns ergeben' antworteten, noch lauter hinaus. Mit unserer Todesfastenoffensive werden wir diese Fahne ein weiteres Mal auf der Festung des Feindes aufpflanzen" begonnen hat, 343 Tage ohne Atempause gelaufen. Er setzte den Widerstand nach seiner Freilassung fort. Seine Gefühle in diesen Tagen hat er folgenderweise zum Ausdruck gebracht: "Heute befinde ich mich innerhalb der großen Familie der Partei-Front, meiner Familie. Ich bin glücklich und stolz. Ich bin gefüllt mit Begeisterung und Freude. Ich befinde mich unter Genossen. Ich bin in einer Gemeinschaft, selbstlos und ohne Rücksicht auf den Tod, ich liebe diese Familie." Diese Familie liebt auch Ihn.

AYSE BASTIMUR:

"Was kann schöner sein als sich der Gewalt zu widersetzen?"
Sie wurde am 24. Januar 1967 in Balikesir-Bigadic als Tochter einer Familie türkischer Herkunft und sunnitischen Glaubens geboren. Sie hat die Volks- und Mittelschule in Bigadic, das Gymnasium für den Medizinberuf in Balikesir abgeschlossen und als Krankenschwester zu arbeiten begonnen. Sie war in verschiedenen Krankenhäusern in Istanbul tätig. Sie arbeitete in der Türkischen Krankenschwesternvereinigung. Ihre erste Bekanntschaft und Sympathie zu unserer Bewegung begann etwa im Jahre 1985. Ab 1987 nahm sie innerhalb unserer organisierten Zusammenhänge teil. Nach eigenen Worten hat sie das organisierte revolutionäre Leben gewählt "weil sie daran glaubte, die Wahrheit gefunden zu haben". Sie übernahm Aufgaben innerhalb der Organisierung der Revolutionären Beamtenbewegung. Im Jahre 1988 wurde sie nach den 1. Mai Demonstrationen inhaftiert und verbrachte zweieinhalb Monate im Gefängnis von Bayrampasa. Nach ihrer Freilassung gab es schließlich eine Ayse die in ihrer Wahl für das Revolutionärtum noch klarer war. Bis zu ihrer Gefangennahme bei der Operation vom 16-17 April 1992 hat sie verschiedene spezielle Aufgaben in unserer Bewegung übernommen.

Nach ihrer zweieinhalbjährigen Gefangenschaft in Bayrampasa wurde sie ins Gefängnis von Canakkale verlegt. Als der Isolationszellen-Angriff an die Tagesordnung kam, nahm sie in der 1. Todesfastengruppe im Gefängnis von Canakkale teil. Während sie sich freiwillig meldete erklärte sie: "Was kann es schöneres geben als sich der Gewalt zu widersetzen?" Am 19. Dezember gehörte sie zu denen, die sich der Folter durch Zwangseingriff entgegenstellten. Sie hat die Bestechung durch Freilassung zurückgewiesen und das "rote Band", welches sie auch draußen um ihre Stirn band, nicht abgeworfen. Denn sie hat an den Sieg geglaubt und gewußt, daß das einzige Mittel gegen Unterdrückung der Widerstand war. Dies hat sie in ihren letzten Worten folgendermaßen zum Ausdruck gebracht:
"Wir haben den Weg beschritten um zu siegen. Die Entwicklungen haben einen noch viel stärkeren Willenskampf erfordert als wir erwartet hatten. Ob nun vorbereitet oder unvorbereitet, es war unsere Ehrenpflicht dies in Kauf zu nehmen. Niemand soll daran zweifeln, die Tage unseres Sieges sind ganz nah."
Wenn sie auch den Sieg nicht erleben konnte, so sah sie ihn vorher und sagte: "Schon jetzt feiere ich den Sieg unseres Volkes und der Weltvölker".

DEVRYMCY HALK KURTULUP CEPHESY
REVOLUTIONÄRE VOLKSBEFREIUNGSFRONT

Datum: 10. Oktober 2001 Erklärung: 215

Schluß mit der Lüge und Demagogie!
Jede auf Afghanistan abgeworfene Bombe ist der Beweis der Realität!
DIES IST EIN EROBERUNGSKRIEG!

Nach tagelanger Propaganda, Manövern, und Demagogien hat sich die amerikanische Kriegsmaschinerie in Bewegung gesetzt und begonnen, das Volk von Afghanistan zu bombardieren.
Dabei war die Rede von Gerechtigkeit, unendlicher Freiheit und vom Anpassungskrieg; Alles gelogen. Mit diesen Diskussionen soll das Wesen des Angriffs verschleiert werden. Die USA bringen Tod und Hunger nach Asien. Die US-Operation ist ein offener, gegen die Weltvölker gerichteter Terrorangriff.
Dieser Krieg, ist der Krieg der USA um die Weltmacht. Es ist der Krieg um das Imperium.
Deshalb wird Afghanistan bombardiert. Deshalb werden Länder, Völker, Organisationen bedroht.

Schluß mit der Lüge und Demagogie!
Die USA Können Nicht Bestimmen, Wie Die Weltvölker Zu Leben Haben!
Die USA erklären 'Taliban wird dafür bezahlen, daß er nicht mit uns kollaboriert', und sagen damit ganz offen, wir werden dein Land in Schutt und Asche legen. Sie sagen 'Mir gefällt dein Regime nicht, ich werde es ändern'. Wo bleiben hier Demokratie, internationales Recht und Gerechtigkeit? Nichts davon ist zu sehen. Es ist absoluter Terror. Sie wechseln die Führungen: Um sie auszutauschen morden sie; die Überlebenden werden Armut und Hunger ausgesetzt, ohne ein Glas sauberes Wasser zu haben in Flüchtlingslager gesperrt.
Wodurch wollen sie denn die Führung ersetzen, während sie mit Bomben und Raketen alles niederbrennen und massakrieren. Sie sagen "Hier habt ihr einen König!".

Die Realität: Jede Abgeworfene Bombe Dient Den Interessen Der Monopole. Das ist die imperialistische Demokratie. In der imperialistischen Demokratie gibt es keine Prinzipien; ihr einziges Prinzip sind die Interessen der Monopole. Hierfür verteidigt sie auch die Monarchie und führt Militärputsche durch. War es nicht sie selbst, die Taliban an die Regierung gebracht hat? Damals stellten die Lebensweise von Taliban und sein Regime kein Problem für Amerika dar. Denn die damaligen Interessen der Monopole lagen darin, die UdSSR-nahe Regierung in Afghanistan umzustürzen.
Es war für die USA zu keiner Zeit bedeutend, ob der Charakter des Regimes in Afghanistan oder das eines anderen Landes demokratisch ist oder nicht; das entscheidende ist für die USA, ob es sich dem Amerikanischen Imperium beugt

oder nicht. Wenn es sich beugt, ist es ein gutes, wenn nicht dann ist es ein schlechtes Regime, das ausgetauscht werden muß. Das Amerikanische Imperium will den letzten Bissen des Volkes, die letzten Überreste der nationalen Willenskraft vernichten. Dies ist das Ziel des Eroberungskrieges. Sein Ziel ist; sich die ganze Welt untertänig zu machen.

Afghanistan Ist Die Tür Zur Eroberung Asiens

Die Hauptverantwortung für alle Gewalt auf der Welt trägt der US-Imperialismus, welcher der Welt sein Imperium aufzwingt. Er macht sich mit dem Vorwand Bin Ladin zu schnappen über die ganze Welt und die Völker lustig. Dies ist eine Operation zur Eroberung, mit der die Märkte Asiens und die Welt erbeutet werden sollen.

Das Imperium führt daran vorbei, den Mittleren Osten, den Balkan und Asien zu erobern. Der Angriff der mit Irak begann und mit Jugoslawien fortgesetzt wurde, richtet sich nun gegen Afghanistan. Weil dem so ist, haben die USA von Beginn an von einer langen Dauer dieses Krieges gesprochen; es ist wahrhaft nicht leicht, Asien und die Welt zu erobern. Der Asiatische Markt, der große Chinesische Markt, die ehemaligen Sowjetländer blenden die imperialistischen Monopole. Die Kriegsmaschinerie Amerikas hat sich in Bewegung gesetzt, um die Erdöllager in diesen Regionen zu beschlagnahmen. Dies ist der ganzen Welt bekannt. Schluß mit der Lüge und Demagogie. Der Angriff auf Afghanistan ist der größte und sichtbarste Zustand der imperialistischen Gewalt.

NATO, EU, UN Haben Sich An Amerika Festgeklammert!

Die USA haben damit begonnen, ihren Plan, Afghanistan zu bombardieren und sich von dort aus in ganz Asien auszubreiten in die Praxis umzusetzen. Die USA erklärten den anderen Imperialisten gegenüber, daß sie dies mit oder ohne ihre Beteiligung tun werden. Die EU hat sich beteiligt, um nicht ein Außensteher dieser Ausbeutung und Plünderung zu sein. So war dies schon beim Angriff auf Irak und Jugoslawien.

Die anderen Imperialisten besitzen weder die Kraft, dies zu verhindern noch die Vorreiterrolle zu übernehmen. Innerhalb dieses Kräftegleichgewichts, haben die USA NATO, EU und UN benutzt, um ihren Angriff zu legitimieren und die NATO den Beschluß fassen lassen, Artikel 5 in Anwendung zu bringen. Den Angriff führen sie im Grunde mit ihren eigenen Kräften durch.

Die Quelle Der Gewalt Ist Amerika Und Sein System.

Die gesamte Geschichte der USA ist gefüllt mit Massakern, Besetzungen, dunklen Geschäften, Attentaten, Komplotten. Sind nicht auch Taliban und Bin Laden, gegen die heute der Krieg geführt wird, jene Kräfte, die mit Unterstützung der USA ins Leben gerufen wurden?

Es sind die USA, die Militärputschs durchführen und Konterguerillaorganisationen aufbauen. Speziell für die Massaker und Militärjuntas, die vom 2. imperialistischen Verteilungskrieg bis in die Gegenwart verwirklicht wurden tragen die USA die Hauptverantwortung. Dieses System wurde für die Ausbeutung und Plünderung der Monopole aufgebaut. Die Bomben sind dessen offenste Erscheinung. Neben jenen, die durch Hunger und Armut getötet werden, stellen die durch Bomben Ermordeten nur einen geringen Anteil dar. Kapitalismus tötet durch Hunger. Dutzende von Institutionen veröffentlichen Statistiken. Die Weltvölker HUNGERN! Und wer läßt sie hungern?

Brot und Gerechtigkeit ist das Recht aller Völker. Wer dieses Recht raubt, ist auch verantwortlich für jede Form von Gewalt. Auf diese Weise wird Gewalt produziert. Den Kindern, die im Kugelhagel aufwachsen und den Völkern die inmitten von Bomben, Raketen und Hungersnot leben müssen, bleibt keine andere Wahl als für Brot und Gerechtigkeit Widerstand zu leisten und zu kämpfen.

Die Völker Besitzen Widerstandskraft Gegenüber Den Besetzern!

Auch die Völker, deren Brot und Gerechtigkeit geraubt werden sagen gegenüber diesem Zwang; 'wir entscheiden selbst, wie wir zu leben haben; auch wir haben das Recht zu regieren. Um dieses Recht in Anspruch zu nehmen, ist es auch unser legitimes Recht Widerstand zu leisten'.

Der Zorn der Weltvölker auf die USA ist nun noch größer geworden. Diese Wut wird sich in ganz unterschiedlichen Formen gegen die USA wenden.

=====
04 Wochentliche ATTAC-Info (41. Woche)
von: ATTAC Österreich, infos@attac-austria.org
=====

1. Erfolg der Aktionen zum Thema Steueroasen am 5. und 6. Oktober
2. 15.10. Attac Treffen Salzburg
3. 19.10. Terminerinnerung Reichtumskonferenz
4. 5.11. Gründung Attac Kärnten
5. 6.11. Start unseres monatlichen ForumAttac in Wien
6. 10.11. WTO Konferenz in Linz
7. 10.11. Ein Jahr ATTAC - Geburtstagsparty ebenfalls in Linz

1. STEUEROASE AKTION im Graben

War ein Erfolg! Nicht nur österreichische Medien waren interessiert, sondern auch internationale (z.B. Reuters). Fotos von unserer Steueroase könnt ihr nicht nur auf unserer Homepage <http://www.attac-austria.org/fotos/oase/oase.php> bewundern, sondern auch in verschiedenen Medien (z. B: Standard und Kurier vom 6.10, Profil 8. Oktober). Weiters gab es eine internationale Aktion in Luxemburg, viele AktivistInnen waren dort, die Infostände wurden gut besucht, Fotos unter www.attac.org/luxembourg.

Der Terror-Anschlag vom 11. September hat die Diskussion über Steueroasen und Geldwäsche ins Licht der Öffentlichkeit gerückt. So ist in der heutigen Ausgabe der Süddeutschen Zeitung ist das Thema des Tages "Konten sperren statt Krieg führen" und in der Einleitung ist zu lesen:..."Terroristen nutzen offenbar oft dieselben Strukturen im internationalen Finanzsystem wie Geldwäscher. Sie eröffnen zum Beispiel Bankkonten von Scheinfirmen in Geldwäsche-Paradiesen, um Spuren zu verwischen. Die Arbeit der Ermittler wird in beiden Fällen durch die Existenz anonymer Konten erschwert.... Der ganze Text ist zu lesen auf: http://szonnet.diz-muenchen.de/REGIS_A13152257

2. Attac Treffen in Salzburg

Am 15. 10. um 18.30 ist im Salzburger Brunauerzentrum das erste Herbsttreffen. Dabei sollen die inhaltlichen Schwerpunkte festgelegt werden und über bereits konkret geplantes diskutiert werden. InteressentInnen kontaktieren Robert Müllner: auge.sbg@demut.at

Die Salzburger ATTAC-Gruppe ist Mitorganisatorin der Veranstaltungsreihe (9.11., 19.11., 7.12.) zum Thema: Seattle-Salzburg-Genua. Globalisierungsprotest und die Gewaltfrage des Salzburger Friedensbüros. Die erste prominent besetzte Veranstaltung findet am 9.11. um 18.00 h statt. Weitere Informationen folgen und sind in Kürze auf der Seite von ATTAC-Salzburg zu lesen.

3. Terminerinnerung: Reichtumskonferenz

Am 19./20. Oktober 2001 findet die Reichtumskonferenz mit einem spannenden

Programm statt, ATTAC ist Mitorganisator. Das Programm findet ihr auf <http://www.attac-austria.org/termine/reichtumskonferenz.php>, Anmeldung und Infos bei: armutskonferenz@akis.at

4. Gründung von ATTAC - Kärnten

Am 5. November ist es auch in Kärnten soweit! ATTAC Kärnten wird gegründet. Und zwar im Rahmen einer Veranstaltung (u.a. mit Bischof Herwig Sturm "Die Welt- ein Casino? Ethische Problem unter dem Einfluss der Finanzmärkte") um 19.00 im Gemeindezentrum St.Ruprecht, in der St. Ruprechterstraße in Klagenfurt. Genauere Details werden nächste Woche bekanntgegeben.

InteressentInnen melden sich bei Walther Schütz: buendnis.oeie@aon.at

5. ForumAttac startet am 6. November

ForumAttac ist unser neuer, monatlicher Treffpunkt für ATTAC-Mitglieder und Interessierte und solche, die es noch werden wollen. Wirkliche statt virtuelle Kommunikation, Gemütlichkeit statt Aktionsstress, zum Kennenlernen für Interessierte; Informationen zu aktuellen Themen, Aktionen,...in Verbindung mit musikalischen Events (DJ, Jazz, Blues. Wer hat Ideen?) oder einfacher Beisl-Athmosphäre

6. November, 19.00 im Depot (Breite Gasse 3, 1070 Wien, hinter Museumsquartier);

Thema: Informationen zum Thema Welthandelsorganisation (WTO) anlässlich der Ministerkonferenz in Qatar und der ATTAC-Konferenz in Linz.
Einleitungsstatement: Christian Felber, ATTAC Österreich

6. WTO KONFERENZ, 10. November Linz

In einem Monat ist es wieder soweit! Nach dem Scheitern der letzten WTO Konferenz in Seattle, findet diese Konferenz an einem Ort statt, wo es kein Demonstrationsrecht gibt! (Doha in Qatar vom 9-13. November). Zudem stehen auf der Agenda nicht nur die Bereiche Gesundheit, Bildung oder Wasserversorgung: Auf Initiative der EU-Kommission gelangt das Thema Investitionen auf die Tagesordnung, was voraussichtlich das berüchtigte Investitionsschutzabkommen MAI wiederbelebt. Nicht zuletzt deshalb finden in ganz Europa Kongresse, alternative Gipfel, Demonstrationen, Aktionen... statt, die eine andere Globalisierung fordern. Zudem werden diese Aktionen gegenüber den Medien von SOS-WTO-EU europaweit koordiniert.

Wir sind natürlich auch dabei: Mit dem Kongress zum Thema "Die Welt ist keine Ware - Qatar/Linz 2001" am 10. November in Linz (Volkshaus Dornach) den ganzen Tag ab 10.00 gemeinsam mit Greenpeace, Dreikönigsaktion, ÖGB Oberösterreich und anderen Organisationen.

Das Gesamtprogramm mit allen Infos wird am Montag getrennt ausgesandt und ist ab dann auch auf unserer Homepage. Wir freuen uns auf zahlreiche Teilnahme!

Im Anschluss an diese Veranstaltung findet am Abend

7. UNSERE GEBURTSTAGSFEIER

statt: ATTAC Österreich ist 1 Jahr alt geworden und beginnt dieses Fest mit einem Kabarett mit LEO LUKAS: "Herzlichen Glückwunsch"
Ab 22.00 geht's dann weiter mit einer Party mit der Hip-Hop Gruppe Die Schwerversprecher und Mc Semmel
Genaueres ebenfalls am Montag

Liebe Grüße

"Der Staat zieht sich immer weiter aus der Verantwortung zurück und gewährt marktwirtschaftlichen Prinzipien von Konkurrenzdenken und Leistungsdruck mehr und mehr Einzug in das Schulwesen. Die Schule sollte selbstdenkende, kritische Persönlichkeiten heranbilden, anstatt der Wirtschaft den vorgeformten Produktionsfaktor Mensch in die Hand zu spielen! Bildung ist Menschenrecht und keine Ware zum Verkauf!", so der AKS-Bundesvorsitzende.

Der 11. Oktober ist gleichzeitig der Startschuss der neuen AKS-Kampagne, die unter demselben Motto auf die Missstände in österreichs Schulen und den neo-konservativen Tenor von österreichs Bildungspolitik aufmerksam machen will. "Die gestrige Präsenz der SchülerInnen stellt einen großen Motivationsschub für unsere Arbeit dar. Wir werden weiterhin unserem Unmut Ausdruck verleihen - die Bildungsministerin kann die Anliegen der SchülerInnen nicht ewig ignorieren.", schließt Kowall.

Rückfragehinweis: Niki Kowall 0699/11408142

=====
07 Depot Programm in der Woche 15. bis 19.10.01
von: depot <koestring@depot.or.at>
=====

Sehr geehrte Damen und Herren, liebe FreundInnen und PartnerInnen des Depot,

in der Anlage finden Sie das Programm des Depot für die kommende Woche.

Wir freuen uns auf Ihr Kommen.

Ein wichtiger Hinweis: Die für Donnerstag, den 18. Oktober geplante Veranstaltung "Luxus - Ökonomie. Feministische Wirtschaftsmodelle" der feministischen Medien wurde leider abgesagt.

Depot-Team

Montag, 15. Oktober, 19.00
Bewegte Männer
Rosa Logar im Gespräch mit Erich Lehner und Stephan Schulmeister

Ist eine politische Umsetzung der Ziele des Feminismus nur möglich, wenn sie von Frauen vorangetrieben werden? Zum Auftakt einer Depot-Reihe über die Zukunft des Feminismus sitzen unter der Moderation von Rosa Logar zwei Männer auf dem Podium: Erich Lehner und Stephan Schulmeister sprechen über den Stellenwert des Feminismus aus dem Blickwinkel ihrer Disziplinen, über Formationen der Abschottung, über Innen- und Außensicht. Ist die Frauenbewegung mittlerweile eine gesellschaftliche Schutzzone geworden und wie funktionieren im Vergleich dazu Männervereinigungen?

Erich Lehner, Theologe, Männer- und Geschlechterforscher, Ludwig Boltzmann-Institut für Werteforschung, Wien.
Stephan Schulmeister, Österreichisches Institut für Wirtschaftsforschung (WIFO), Wien.
Rosa Logar, Geschäftsführerin der Interventionsstelle gegen Gewalt, Wien.

Dienstag, 16. Oktober, 19.00
Podiumsdiskussion
Elektronische Demokratie?

Unter welchen Bedingungen könnte Online Voting sinnvoll sein und zwar nicht nur, um die technische Durchführung demokratischer Wahlen zu vereinfachen, sondern auch, um die Demokratie zu stärken? Durch die Einbindung der User in Communities und Wahlbörsen könnte sich die

Möglichkeit einer höheren Wahlbeteiligung ergeben, wenn der technological gap zwischen Usern und Non-Usern überwunden werden kann.

Die Aktion Vote-Auction (www.voteauction.at) der Gruppe übermorgen, hat vor einem Jahr für die Wahlprozeduren in den USA eine "Vereinfachung" vorgeschlagen; eine Verbindung von Demokratie und Kapitalismus sollte direkt den WählerInnen zukommen.

Katharina Gsöllpointner, Kunst-, Kultur- und Medientheoretikerin, Wien.
lizvix und hans_extrem, KünstlerInnen der Gruppe übermorgen, Wien.
Gregor Matjan, Politikwissenschaftler, Institut für Politikwissenschaft der Universität Wien.

08 INTERFACE EXPLORER 18./19. Oktober 2001 -> 2nd Announcement
von: Martin Wassermair <wassermair@t0.or.at>
=====

|---
VERANSTALTUNGSANKÜNDIGUNG pt.2
Public Netbase Media~Space!
Institut für Neue Kulturtechnologien/t0

|---
| INTERFACE EXPLORER
| Shared Boundaries
|
<http://interface.t0.or.at/>

|---
| Ein Public Netbase Event im "Zwischenquartier" mit:
|
| Markus Bader/DE, Jonah Brucker-Cohen/US, Matthew Fuller/UK,
| Patricia Futterer/AT, Mieke Gerritzen/NL, Johannes Grenzfurthner/AT,
| Graham Harwood/UK, Margarete Jahrmann/AT, Joes Koppers/NL , Christoph
| Kummerer/AT, Pär Lannerö/SE, Lev Manovich/US/RU, Max Moswitzer/AT,
Peter Purgathofer/AT, Gebhard Sengmüller/AT, Stijn Slabbinck/BE

|---
18./19. Oktober 2001, jeweils ab 19 Uhr

Die Veranstaltung thematisiert den Umgang mit Interfaces (Deutsch: Verbindung, Schnittstelle, Zwischenstück) und versucht, ihre Vielseitigkeit im Zusammenhang mit neuen Informationstechnologien zu erklären. Dabei beschränkt sich der Blick nicht auf einen theoretischen Diskurs, sondern er sucht auch ganz bewusst einen spielerischen Zugang. Neben der Präsentation einer Reihe von PC- und Web-Interfaces werden auch Arbeiten von KünstlerInnen vorgestellt, die sich diesem Thema auf

allgemeinere Art annähern und eigene sowie auch eigenwillige Umsetzungen erarbeiten.

Lev Manovich, ein bedeutender Theoretiker der Neuen Medien, beschreibt in seinem aktuellen Buch "The Language of New Media" die kulturelle Dimension der digitalen Technologien und die Entwicklung der neuer Mensch/Maschine-Interfaces. Er wird im Rahmen seines Vortrags am 18. Oktober einige Grundlagen des kulturellen elektronischen Interfaces vorstellen und nicht nur Software-Kultur, sondern auch Kultur als Software begreifbar machen.

Am 19. Oktober folgt ein Panelgespräch zum Stand der Entwicklung kultureller Interfaces. ExpertInnen und EntwicklerInnen diskutieren dabei die gegenwärtig vorhandenen Ansätze im Interface Design. Mieke Gerritzen von NL.Design war eine der BegründerInnen des Internationalen Browserday, der vor 4 Jahren erstmals in Amsterdam und zuletzt in New York veranstaltet wurde, um Alternativen zu den bestehenden Web-Browsern aufzuzeigen. Zwei Gewinner der Browserday Awards - Joes Koppers (NL) und Jonah Brucker-Cohen (US) - werden ihre Projekte selbst vorstellen.

Die Künstler Harwood/Fuller beschäftigen sich seit langem mit den sozialen und sozio-kognitiven Aspekten der digitalen Informationsinteraktion. Sie präsentieren mit "TEXT-FM" ein text-to-speech-to-radio Projekt, bei dem über SMS anonyme Mitteilungen von einem Mobiltelefon gesendet werden und ein Computer einen über Sprache vermittelten Informationsaustausch ermöglicht.

Die Präsentationen und Installationen zeigen die Einbeziehung von Audio- und Videosystemen in das elektronische Interface - von Scratchrobot, TimeCodeVinyl, VinylVideo und Climax-Action Bot Concert bis hin zu webgesteuerter Discokugel-Musik und Musical Web-Pads.

| Ausstellung der INTERFACE EXPLORER Installationen bis Freitag,
| 9. November 2001 im Public Netbase Zwischenquartier
Geöffnet: Montag bis Freitag, von 14.00 bis 19.00 Uhr.

09 In den Fängen des Dr. Gross
von: augustin <augustin@nextra.at>

=====

In den Fängen des Dr. Gross
Eine Veranstaltung am Dienstag, 16. Oktober
im Aktionsradius Augarten

Mit skandalöser Verspätung hat nun der Bund Sozialdemokratischer Akademiker (BSA) eine Aufarbeitung des Falles Heinrich Gross in Auftrag gegeben. BSA-Präsident und Wiens Vizebürgermeister Sepp Rieder gestand dieser Tage, es sei ein Fehler gewesen, die Frage der BSA-Mitgliedschaft des berüchtigten NS-Arztes auf dem Spiegelgrund nicht offensiver angegangen zu sein. Nun ist Wolfgang Neugebauer, Leiter des Dokumentationsarchivs des Österreichischen Widerstands, mit einer Untersuchung beauftragt worden. Bereits im Juni hatte die Führung der Ludwig-Boltzmann-Gesellschaft um Verzeihung gebeten. Die Gesellschaft hatte dem NS-Arzt - man wirft ihm mehrfachen Mord an geistig behinderten Kindern vor - Unterschlupf gewährt und ihn mit einem Gehirnforschungsinstitut versorgt.

Hätten nicht der Journalist Oliver Lehmann und die Zeitgeschichtlerin Traudl Schmidt mit ihrem Buch "In den Fängen des Dr. Gross" (Czernin Verlag) die Öffentlichkeit aufgewühlt - der braune Fleck im BSA wäre wohl weiter nicht angegangen worden. Oliver Lehmann wird im Aktionsradius Augarten sein Buch vorstellen und über die Lawine berichten, die er damit losgetreten hat. Die Wiener Ärztin Dr. Karin Mosser, Leiterin des Gedenk- und Forschungsprojekts in der Causa Gross (im Auftrag der Gemeinde Wien), wird über die Pläne der Errichtung einer Gedenkstätte auf dem Baumgartner Höhe und der Bestattung der Hirne der ermordeten Kinder berichten. Einige Überlebende vom Spiegelgrund werden für Anfragen zur Verfügung stehen.

Ort: Wien 20, Gaußplatz 11
Beginn: 19:30. Eintritt frei.

10 1 Jahr Todesfasten in der Türkei
von: PWI <info@pwi.action.at>

=====

An die demokratische Öffentlichkeit!

Das gestrige Koordinationstreffen hat für den Jahrestag des Todesfastens der politischen Gefangenen in der Türkei und ihrer Angehörigen folgendes beschlossen:

SOLIDARITÄTSDEMONSTRATION

Ort: Europaplatz/Westbahnhof
Datum: Samstag, 20. Oktober 2001
Zeit: 14.00 Uhr

Die bisherigen UnterstützerInnen sind:
AIK - Antiimperialistische Koordination
RKL - Revolutionär Kommunistische Liga
BsB - Bewegung für soziale Befreiung
Rat zur Verteidigung des Kampfes der iranischen Völker
ÖZTUDAK - TIKB
TAYAD - Solidaritätskomitee Wien
DHKC Wien
KPÖ Wien
Gesellschaft für bedrohte Völker

Falls noch jemand diese Aktion unterstützen möchte, dann schreibt bitte ein Mail an Prison Watch International - Wien.

>Battalion staff on how to coordinate effective air operations with a
>sister service.
>Based on that experience, and operations in eight designated conflict
>areas from Vietnam to Haiti, I have to say that the story we hear on the
>news and read in the newspapers is simply not believable. The most cursory
>glance at the verifiable facts, before, during, and after September 11th,
>does not support the official line or conform to the current actions of
>the United States government.
>But the official line only works if they can get everyone to accept its
>underlying premises. I'm not at all surprised about the Republican and
>Democratic Parties repeating these premises. They are simply two factions
>within a single dominant political class, and both are financed by the
>same economic powerhouses. My biggest disappointment, as someone who
>identifies himself with the left, has been the tacit acceptance of those
>premises by others on the left, sometimes naively, and sometimes to score
>some morality points. Those premises are twofold. One, there is the
>premise that what this de facto administration is doing now is a
>"response" to September 11th. Two, there is the premise that this attack
>on the World Trade Center and the Pentagon was done by people based in
>Afghanistan. In my opinion, neither of these is sound.
>To put this in perspective we have to go back not to September 11th, but
>to last year or further.
>A man of limited intelligence, George W. Bush, with nothing more than his
>name and the behind-the-scenes pressure of his powerful father-a former
>President, ex-director of Central Intelligence, and an oil man-is
>systematically constructed as a candidate, at tremendous cost. Across the
>country, subtle and not-so-subtle mechanisms are put into place to
>disfranchise a significant fraction of the Democrat's African-American
>voter base. This doesn't come out until Florida becomes a battleground for
>Electoral College votes, and the magnitude of the story has been
>suppressed by the corporate media to this day. In a decision so lacking in
>legitimacy, the Supreme Court will neither by-line the author of the
>decision nor allow the decision to ever be used as a precedent, Bush v.
>Gore awards the presidency of the United States to a man who loses the
>popular vote in Florida and loses the national popular vote by over
>600,000.
>This de facto regime then organizes a very interesting cabinet. The Vice
>President is an oil executive and the former Secretary of Defense. The
>National Security Advisor is a director on the board of a transnational
>oil corporation and a Russia scholar. The Secretary of State is a man with
>no diplomatic experience whatsoever, and the former Chair of the Joint
>Chiefs of Staff. The other interesting appointment is Donald Rumsfeld as
>Secretary of Defense. Rumsfeld is the former CEO of Searle
>Pharmaceuticals. He and Cheney were featured as speakers at the May, 2000,
>Russian-American Business Leaders Forum. So the consistent currents in
>this cabinet are petroleum, the former Soviet Union, and the military.
>Based on the record of Daddy Bush, in all his guises, and the general
>trajectory of US foreign policy as far back as the Carter Administration,
>I feel I can reasonably conclude that Middle Eastern and South Asian
>fossil fuels are one of their major preoccupations. Not just because this
>klavern has some very direct financial interests in fossil fuel, but
>because they surely know that worldwide oil production is peaking as we
>speak, and will soon begin a permanent and precipitous decline that will
>completely change the character of civilization as we know it within 20
>years. Even the left seems to be in deep denial about this, but the math
>is available. And, no, alternative energies and energy technologies will

>not save us. All the alternatives in the world can not begin to provide
>more than a tiny fraction of the energy base now provided by oil. This
>makes it more than a resource, and the drive to control what's left more
>than an economic competition.
>I further conclude that the economic colonization of the former Soviet
>Union is probably high on that agenda, and in fact has a powerful synergy
>with the issue of petroleum. Russia not only holds vast untapped resources
>that beckon to imperialism in crisis, it remains a credible military and
>nuclear challenger in the region.
>We have not one, but three members of the Bush de facto cabinet with
>military credentials, which makes the cabinet look quite a lot like a
>military General Staff. All this way before September 11th.
>Then there's the subject of the North Atlantic Treaty Organization. NATO
>might have expected consignment to the dustbin of the Cold War after the
>Eastern Bloc shattered in 1991. Peace dividend and all that. But it
>didn't. It expanded directly into the former states of the Eastern Bloc
>toward the former Soviet Union, and contributed significant forces to the
>devastation of Iraq-a key country in the world oil market, over which
>control translates into the ability to manipulate oil prices.
>NATO is a military formation, and the United States exerts the controlling
>interest in it. It seemed like a form without a function, but it remedied
>that pretty quickly.
>Then when Yugoslavia refused to play ball with the International Monetary
>Fund, the US and Germany began a systematic campaign of destabilization
>there, even using some of the veterans of Afghanistan in that campaign.
>NATO became the military arm of that agenda-the break-up of Yugoslavia
>into compliant statelets, the further containment of the former Soviet
>Union, and the future pipeline easement for Caspian Sea oil to Western
>European markets through Kosovo.
>You see, this is important to understand, and people-even those against
>the war talk-are tending to overlook the significance of it. NATO is not a
>guarantor of international law, and it is not a humanitarian organization.
>It is a military alliance with one very dominant partner. And it can no
>longer claim to be a defensive alliance against European socialists. It is
>an instrument of military aggression.
>NATO is the organization that is now going to thrust further along the
>40th parallel from the Balkans through the Southern Asian Republics of the
>former Soviet Union. The US military has already taken control of a base
>in Uzbekistan. No one is talking about how what we are doing seems to be a
>very logical extension of a strategy that was already in motion, and has
>been in motion for two decades. Once we recognize the pattern of activity
>designed to simultaneously consolidate control over Middle Eastern and
>South Asian oil, and contain and colonize the former Soviet Union,
>Afghanistan is exactly where they need to go to pursue that agenda.
>Afghanistan borders Iran, India, and even China but, more importantly, the
>Central Asian Republics of the former Soviet Union, Uzbekistan,
>Turkmenistan and Tajikistan. These border Kazakhstan. Kazakhstan borders
>Russia. Turkmenistan sits on the Southeastern quadrant of the Caspian Sea,
>whose oil the Bush Administration dearly covets.
>Afghanistan is necessary for two things: as a base of operations to begin
>the process of destabilizing, breaking off, and establishing control over
>the South Asian Republics, which will begin within the next 18-24 months
>in my opinion, and constructing a pipeline through Turkmenistan,
>Afghanistan, and Pakistan to deliver petroleum to the Asian market.
>The BBC was recently told by Niaz Naik, a Pakistani Foreign Secretary,
>that senior American officials were warning them as early as mid-July that
>military action for mid-October was being planned for Afghanistan. In
>1996, the Department of Energy was issuing reports on the desirability of
>a pipeline through Afghanistan, and in 1998, Unocal testified before the
>House Subcommittee on Asia and the Pacific that this pipeline was crucial
>to transport Caspian Basin oil to the Indian Ocean.
>Given this evidence that a military operation to secure at least a portion
>of Afghanistan has been on the table, possibly as early as five years ago,
>I can't help but conclude that the actions we are seeing put into motion
>now are part of a pre-September 11th agenda. I'm absolutely sure of that,
>in fact. The planning alone for operations, of this scale, that are now
>taking shape, would take many months. And we are seeing them take shape in

>mere weeks.
>It defies common sense. This administration is lying about this whole
>thing being a "reaction" to September 11th. That leads me, in short order,
>to be very suspicious of their yet-to-be-provided evidence that someone in
>Afghanistan is responsible. It's just too damn convenient. Which also
>leads me to wonder-just for the sake of knowing-what actually did happen
>on September 11th, and who actually is responsible.
>The so-called evidence is a farce. The US presented Tony Blair's puppet
>government with the evidence, and of the 70 so-called points of evidence,
>only nine even referred to the attacks on the World Trade Center, and
>those points were conjectural. This is a bullshit story from beginning to
>end. Presented with the available facts, any 16-year old with a liking for
>courtroom dramas could tear this story apart like a two-dollar shirt. But
>our corporate press regurgitates it uncritically. But then, as we should
>know by now, their role is to legitimize.
>This cartoon heavy they've turned bin Laden into makes no sense, when you
>begin to appreciate the complexity and synchronicity of the attacks. As a
>former military person who's been involved in the development of countless
>operations orders over the years, I can tell you that this was a very
>sophisticated and costly enterprise that would have left what we call a
>huge "signature".
>In other words, it would be very hard to effectively conceal.
>So there's a real question about why there was no warning of this. That
>can be a question about the efficacy of the government's intelligence
>apparatus. That can be a question about various policies in the various
>agencies that had to be duped to orchestrate this action. And it can also
>be a question about whether or not there was foreknowledge of the event,
>and that foreknowledge is being covered up. To dismiss this concern out of
>hand as the rantings of conspiracy nuts is premature. And there is a
>history of this kind of thing being done by national political bosses,
>including the darling of liberals, Franklin Roosevelt. The evidence is
>very compelling that the Roosevelt Administration deliberately failed to
>act to stop Pearl Harbor in order to mobilize enough national anger to
>enter the World War II.
>I have no idea why people aren't asking some very specific questions about
>the actions of Bush and company on the day of the attacks.
>Follow along:
>Four planes get hijacked and deviate from their flight plans, all the
>while on FAA radar. The planes are all hijacked between 7:45 and 8:10 AM
>Eastern Daylight Time.
>Who is notified?
>This is an event already that is unprecedented. But the President is not
>notified and going to a Florida elementary school to hear children read.
>By around 8:15 AM, it should be very apparent that something is terribly
>wrong. The President is glad-handing teachers.
>By 8:45, when American Airlines Flight 11 crashes into the World Trade
>Center, Bush is settling in with children for his photo ops at Booker
>Elementary. Four planes have obviously been hijacked simultaneously, an
>event never before seen in history, and one has just dived into the worlds
>best know twin towers, and still no one notifies the nominal Commander in
>Chief.
>No one has apparently scrambled any Air Force interceptors either.
>At 9:03, United Flight 175 crashes into the remaining World Trade Center
>building. At 9:05, Andrew Card, the Presidential Chief of Staff whispers
>to George W. Bush. Bush "briefly turns somber" according to reporters.
>Does he cancel the school visit and convene an emergency meeting? No.
>He resumes listening to second graders read about a little girl's pet
>fucking goat, and continues this banality even as American Airlines Flight
>77 conducts an unscheduled point turn over Ohio and heads in the direction
>of Washington DC.
>Has he instructed Chief of Staff Card to scramble the Air Force? No.
>An excruciating 25 minutes later, he finally deigns to give a public
>statement telling the United States what they already have figured out;
>that there's been an attack by hijacked planes on the World Trade Center.
>There's a hijacked plane bee-lining to Washington, but has the Air Force
>been scrambled to defend anything yet? No.
>At 9:30, when he makes his announcement, American Flight 77 is still ten

>minutes from its target, the Pentagon.
>The Administration will later claim they had no way of knowing that the
>Pentagon might be a target, and that they thought Flight 77 was headed to
>the White House, but the fact is that the plane has already flown South
>and past the White House no-fly zone, and is in fact tearing through the
>sky at over 400 nauts.
>At 9:35, this plane conducts another turn, 360 degrees over the Pentagon,
>all the while being tracked by radar, and the Pentagon is not evacuated,
>and there are still no fast-movers from the Air Force in the sky over
>Alexandria and DC.
>Now, the real kicker: A pilot they want us to believe was trained at a
>Florida puddle-jumper school for Piper Cubs and Cessnas, conducts a
>well-controlled downward spiral, descending the last 7,000 feet in
>two-and-a-half minutes, brings the plane in so low and flat that it clips
>the electrical wires across the street from the Pentagon, and flies it
>with pinpoint accuracy into the side of this building at 460 nauts.
>When the theory about learning to fly this well at the puddle-jumper
>school began to lose ground, it was added that they received further
>training on a flight simulator.
>This is like saying you prepared your teenager for her first drive on I-40
>at rush hour by buying her a video driving game. It's horse shit!
>There is a story being constructed about these events. My crystal ball is
>not working today, so I can't say why.
>But at the least, this so-called Commander-in-Chief and his staff that we
>are all supposed to follow blindly into some ill-defined war on terrorism
>is criminally negligent or unspeakably stupid. And at the worst, if more
>is known or was known, and there is an effort to conceal the facts, there
>is a criminal conspiracy going on.
>Certainly, the Bush de facto administration was facing a confluence of
>crises from which they were temporarily rescued by this event. Whether
>they played a sinister role or not, there is little doubt that they have
>at the very least opportunistically pounced on this attack to overcome
>their lack of legitimacy, to shift the blame for the encroaching recession
>from capitalism to the September 11th terror attack, to legitimize their
>pre-existing foreign policy agenda, and to establish and consolidate
>repressive measures domestically and silence dissent. In many ways,
>September 11th pulled the Bush cookies out of the fire.
>And given them the green light to begin constructing a long-term scenario
>within which to establish fascistic control measures at home and abroad as
>a citadel for the ruling class in the catastrophic conjuncture that we are
>entering based on the end of oil.
>This elephant in the living room is being studiously ignored. In fact, the
>domestic repression has already begun, officially and unofficially. It's
>kind of a latter day McCarthyism. I participated in a teach-in at Chapel
>Hill, North Carolina, on the 17th of September, and though not a single
>person on the panel excused or justified the attacks, and every person
>there offered either condolences and prayers for the victims, we were
>excoriated within two days as "enemies of America." Yesterday an op-ed
>called for my deportation (to where, one can only guess). Now Herr
>Ashcroft is fast tracking the biggest abrogation of US civil liberties
>since the so-called anti-terrorism legislation after the Oklahoma City
>bombing - which by the way hasn't resulted in anti-terrorism but in the
>acceleration of the application of the racist death penalty. The FBI has
>defined terrorist groups not by whether any given group has ever acted as
>terrorists, but by their beliefs. Some socialists and anti-globalization
>groups have already been identified by name as terrorist groups, even
>though there is not a single shred of evidence that they have ever
>participated in any criminal activity. It reminds me of the Smith Act that
>was finally declared unconstitutional, but only after a hell of a lot of
>people served a hell of a long time in jail for the crime of thinking.
>I think this also points to yet another huge problems that the Bush regime
>was facing. Worldwide resistance to the whole so-called neoliberal agenda,
>which is a prettied up term for debt-leverage imperialism. While debt and
>the threat of sanctions has been used to coerce nations in the periphery,
>we have to understand that the final guarantor of compliance remains
>military action. For a global economic agenda, there is always a
>corresponding political and military agenda.

>The focal point of these actions in the short term is Southern Asia, but
>they have already scripted this as a worldwide and protracted fight
>against terrorism.
>It's far better than drug wars as a rationalization, and the drug war
>thing was being discredited in any case. Leftists are regaining power and
>popularity in Venezuela, El Salvador, Nicaragua, Ecuador, Colombia, the
>Dominican Republic, Haiti, Brazil, and Argentina. Cuba has gained immense
>prestige over the last few years. The empire is beginning to unravel. We
>can hardly justify intervention in these places by saying they are not
>towing the economic line by allowing the absolute domination of their
>societies by transnational corporations. That exposes the agenda. So we
>simply claim they are supporting terrorism.
>It's for all these reasons I say the left has missed the boat on this one,
>by allowing them to get away with rushing past the question of who did
>what on September 11th. If the official story is a lie, and I think the
>circumstantial case is strong enough to stay with this question, then we
>really do need to know what happened. And we need to understand concretely
>what the motives of this administration are.
>And we need to understand more than just their immediate motives, but
>where the larger social forces that underwrite our situation right now are
>headed. I do not think this administration is engaged in the deliberative
>process of a political grouping that is on top of their game. They are
>putting together some very deliberative technical solutions in response to
>a larger situation that it slipping rapidly out of their control. Like
>clear cutting. There's a very smart technology being employed to do a very
>dumb thing.
>What they are responding to is not September 11th, but the beginning of a
>permanent and precipitous decline in worldwide oil production, the
>beginning of a deep and protracted worldwide recession, and the unraveling
>of the empire.
>This brings me to a point about what all this means for Americans'
>security, which they are perfectly justified to worry about. The actions
>being prepared by this administration will not only not enhance our
>security, it will significantly degrade it. Military action against many
>groups across the globe, which is what the administration is telling us
>quite openly they are planning to do, will put a lot of backs against the
>wall. That can't be very secure.
>The concept of war being touted here is a violation of the principles of
>war on several counts, and will inevitably lead to military catastrophes,
>if you're inclined to view this from a position of moral and political
>neutrality.
>And the people who are now in possession of half the world's remaining oil
>reserves are subject to destabilization for which we can't even pretend to
>predict the consequences-but loss of access to critical energy supplies is
>certainly within the realm of possibility. Worst of all, we will be
>destabilizing Pakistan, a nuclear power in an active conflict with its
>neighbor, and we will be provoking Russia, another nuclear power. The
>security stakes don't get any higher, and Americans can ill afford to
>ignore nukes.
>And I think that this domestic agenda is a tremendous threat to the
>security of anyone who is critical of the government or their corporate
>financiers, and we already know that the real threats are against
>populations that can easily be scapegoated as the domestic crisis deepens.
>There is a very real threat right now of creeping fascism in this country,
>and that phenomenon requires its domestic enemies. Historically those
>enemies have included leftists, trade unionists, and racially and
>nationally oppressed sectors. This whole "state of emergency" mentality is
>already being used to quiet the public discourses of anti-racism, of
>feminism, of environmentalism, and of both socialism and anarchism. And
>while there is token resistance by officials to anti-Muslim xenophobia,
>the stereotypical images have saturated the media, and the government is
>already beginning to openly re-instate racial profiling. It is only a
>short step from there to go after other groups. We have long been prepared
>by the ideologies of overt and covert racism, and racism as both
>institution and corresponding psychology in the United States is nearly
>intractable.
>It's for all these reasons that I say emphatically that we can not accept

>anything from this administration; not their policies nor their bullshit
>stories. What they are doing is very, very dangerous, and the time to
>fight back against them, openly, is right now, before they can consolidate
>their power and their agenda. Once they have done that, our job becomes
>much more difficult.
>The left, if it has the capacity to self-organize out of its oblivion,
>needs to understand its critical roles here. We have to play the role of
>credible, hard-working, and non-sectarian partners in a broader
>peace-movement. We have to study, synthesize, and describe our current
>historical conjuncture. And we have to prepare leadership for the decisive
>conflict that will emerge to first defeat fascism then take political
power.
>Rosa Luxemburg's words are truer than ever right now. We are not faced
>with a choice between socialism and capitalism, but socialism or barbarism.
>And what we can least afford are denial and timidity.

02 4 Gefallene Im Großen Widerstand
von: Revolutionäre Volksbefreiungsfront <press@dhkc.org>
=====

4 Gefallene Im Großen Widerstand
Unsere, Mit 72 Gefallenen Größer werdende Rechnung
Der Widerstand Jener, Die sich für eine unabhängige Türkei anstelle von der
Amerikanischen Regierung aussprechen
Der Marsch der Patrioten gegen die Landesverräter

DIE PATRIOTEN DIE SICH IM WIDERSTAND FÜR BROT UND GERECHTIGKEIT BEFINDEN
WERDEN SIEGEN

Zeynep Arıkan Gülbag, die genau 343 Tage lang die Worte "Für unser Volk, das
bisher kein Glück erfahren konnte..." auf ihrem Stirnband trug, hat sich am
27. September in Armutlu zu den Helden unseres unbesiegbaren Volkes begeben.
Ali Rıza Demir ist auf seinem Marsch, den er am 20. Oktober 2000 mit den
Worten "Wir werden die Volksfeinde, Imperialisten und ihre Kollaborateure
daran hindern, unser Volk auszubeuten und unser Land Stück für Stück zu
verkaufen" angetreten hat, am 27. September, den 343. Tag des Widerstands in
Armutlu unsterblich geworden.

Ayşe Bastımur krönte ihren Kampf, den sie opferbereit mit den Worten "Wir
werden auf den Böden unseres Landes Welle für Welle zur Freiheitshoffnung
werden" aufgenommen, am 28. September, den 342. Tag ihres Widerstands in Ankara
mit ihrem Martyrertum.

Özlem Durakcan ist in ihrem Widerstand, den sie vor 74 Tagen mit den Worten
"Ich bin gegen Ungleichheit, Ausbeutung, Ungerechtigkeit, ich will ein Land
in dem man menschlich leben kann" begonnen hat, am 28. September in Ankara
gefallen.

Die Karawane zieht mit 4 Gefallenen in zwei Tagen weiter. Der Kampf gegen
die Tyrannei der Pro-Amerikaner setzt sich gnadenlos fort.

Zeynep, Ali Rıza und Ayşe... Sie sind KämpferInnen der 1. Todesfastengruppe,
unsere drei Helden und Herzen, die Massaker, Unterdrückung, Folter,
Bestechung und Zeit nicht von ihrem Weg abbringen konnten.

Özlem... das junge Herz der Verantwortung, eine junge Anhängerin des TAYAD,
die ihr Leben denen gewidmet hat, die sich der Unterdrückung widersetzen.

Zeynep, Ali Rıza und Ayşe waren WiderstandskämpferInnen der 1.
Todesfastengruppe. Sie wurden freigelassen. Sie haben nicht einmal für einen
Moment an Verrat gedacht. Sie haben nicht gezögert. Sie haben auf das
Gesicht des Verrats gespuckt, der über unsere Leichen gehend zum Vorschein
trat, und ihren Weg fortgesetzt. Drei Fäuste prallten eine nach dem anderen
auf das Gesicht des Verrats aus dem alles Leben gewichen ist.

Mit 4 Rosen haben wir die Brust der Unterdrückung mitsamt ihrer Kugel
geschlagen. Während unser in einem Atemzug fortgesetzter Widerstand bald 1
Jahr vollendet hat, ist aus unseren Gefallenen mittlerweile ein Berg
entstanden. Wir haben genau 72 Leben gegeben in diesem Kampf. Wir sind 72
Mal gestorben, seitdem die Oligarchie gegen das Volk der Türkei einen Krieg
eröffnet hat.

In diesen 344 Tagen sind wir genau 72 Mal gestorben, aber die Hand des Widerstands hat nicht ein einziges Mal gezittert. Nicht ein einziges Mal konnten sie in die Knie gezwungen werden.

Die Geschichte ist nicht müde geworden, weiterhin unsere Heldenepen niederzuschreiben. Anatolien wurde durch unseren Schrei der Rebellion, der sich gegen die Tyrannei von seinen Böden erhebt, geehrt. Es hat die Namen unserer Helden mit rotem Stirnband an der Seite der würdevollsten Kinder einer tausende Jahre existierenden Menschheitsgeschichte verewigt.

DIE REGIERUNG MUSS VON IHRER ILLUSION UND IHREN LÜGEN ABWEICHEN

Den Krieg, den Amerika zur Stabilisierung seines Imperiums mit der Lüge "gegen den Terror" begonnen hat als Gelegenheit nutzend, hat sich die Oligarchie noch intensiver an Lügen wie "Das Todesfasten wird vom Ausland gelenkt" geklammert, um ihren mörderhaften Charakter legitim zu zeigen.. Wie bedauernswert.

Was gestern die lügenerischen Minister und Regierungen gesagt haben, wird heute schamlos und ungeniert vom heuchlerischen General Yasar Büyükanit nachgeplaudert.

Wir verkünden der ganzen Welt ein weiteres Mal; ihr sucht die Führungszentrale des Widerstands?

Das Zentrum des Widerstands, sein Stützpunkt, die ihn Leitenden und Ausführenden sind unsere Menschen, die den Tod in Kauf genommen haben. Ihr könnt mit Euren Lügen nicht den Widerstand brechen, sondern Euch damit lediglich vor der ganzen Welt lächerlich machen.

Die Gefangenen haben dies mit den Worten "Selbst wenn ein Einziger von uns zurückbleibt, wird der Widerstand andauern" erklärt.

Es ist eine Illusion, auf das Ende des Widerstands zu warten, ohne daß die Forderungen erfüllt wurden.

Es ist eine Illusion zu erwarten, daß uns Zeit, Unterdrückung und Tod einschüchtern.

Gebt diese Illusion auf. Akzeptiert die Forderungen der Gefangenen ehe ihr eure Schuld und die Wut vergrößert.

Stoppt die Isolation.

Die 7. Todesfastengruppen, die am 26. September den Widerstand begonnen haben, sind der Beweis für die Entschlossenheit und dafür, wie brennend und unverzichtbar die Forderungen sind.

Allein die 4 Helden, die innerhalb von zwei Tagen gefallen sind, geben den besten Beweis dafür ab, daß der Widerstand einen großen Preis in Kauf nimmt.

Jene, die immer noch darauf warten, daß der Widerstand von selbst endet, sind entweder schwer von Begriff oder leben nicht in diesem Land.

WIR LEISTEN WIDERSTAND GEGEN DIE TYRANNEI DER PRO-AMERIKANISCHEN REGIERUNG

Diese Regierung hat weder mit dem Volk noch mit dem Land irgendetwas zu tun.

Das Volk ist hungig, arm, arbeitslos, mit Ausnahme einer Handvoll

Kollaborateure will niemand die Böden unseres Landes an das Amerikanische Imperium verschenken. Das Land ist zur Hölle geworden, aber das kümmert die Regierung überhaupt nicht.

Sie sagen "Volle Unterstützung an Amerika" und nichts weiter.

DIESE REGIERUNG EXISTIERT LEDIGLICH FÜR DIE INTERESSEN DES AMERIKANISCHEN IMPERIUMS.

Sie haben die Führung des Landes den Konsulen der USA und dem IMF ausgehändigt.

Der amerikanische Außenminister klatscht in die Hände und sie begeben sich Hals über Kopf in die USA. Sie sagen "Wir stehen bedingungslos in Eurem Befehl".

Das arme Volk des in einen Feuerherd verwandelten Anatoliens ruft "WIR SIND HUNGRIG", doch sie drehen sich nicht einmal nach ihm um.

Die Knechtschaft hat eine derartige Dimension angenommen, Bush spricht von "Kreuzzügen" und diese Regierung korrigiert ihn "es handelt sich um ein Mißverständnis". Die ganze Welt kritisiert Bush, aber diese Regierung gibt kein Wort von sich.

Diese Regierung sagt nur: "Völlige Unterstützung an Amerika". Diese Regierung will unser Land zu einem Bundesland Amerika's machen!

WIR WERDEN DIES NIEMALS ZULASSEN!

Kann das Amerikanische Imperium ein Volk, aus dem 4 Helden im gleichen Zeitraum wie ein Messer auf die Brust der Unterdrückung einstechen, zu seinem Untertanen machen?

Solange dieses Volk Helden wie diese hervorbringt, sich Hunderte von Freiheitskämpfern für Brot und Gerechtigkeit mit Aufopferungsgeist schmücken; können jene, die eine Operation zur Eroberung der Welt beginnen und sagen, daß Systeme, die auf Egoismus, Profit, Lügen, Plünderung, Raub, Ausbeutung und Massaker aufgebaut sind "die überlegenste Zivilisation sind", sowie deren Kollaborateure in unserem Land das Volk nicht zur Ergebung zwingen.

Unser Widerstand ist der Widerstand des nicht kapitulierenden Volkes.
Unser Widerstand ist der Widerstand der Patrioten gegen den Landesverrat.
Unser Widerstand ist das unzerbrechliche Monument der Losung "Unabhängige Türkei" gegen die pro-amerikanische Regierung. Unser Widerstand ist gegen das Unterdrückungs- und Ungerechtigkeitsystem des US-Imperiums und seiner Kollaborateure, die einen Krieg ansagen, um auf der Welt keine einzige oppositionelle Kraft übrigzulassen. Als die Oligarchie zusammen mit dem IMF dem Volk den Krieg erklärt und als wichtigen Teil dessen die F Typ Gefängnisse an die Tagesordnung gebracht hat, stellten wir ihr unseren Widerstand entgegen; heute, wo Amerika allen unterdrückten Völkern der Welt den Krieg erklärt, geben wir unsere Antwort im Widerstand.

Wir verkünden der ganzen Welt, daß der Pro-Amerikanismus auf diesem Boden keine Ruhe finden wird. Unser Todesfastenwiderstand ist ein prunkvolles Manifest aller dem Volk angehörenden Werte gegenüber der pro-amerikanischen Kultur. Genau dann, wenn die Pro-Amerikaner denken, daß sie alle Gehirne mit der amerikanischen Kultur beschmutzen konnten; explodieren wir wie ein Vulkan, aus dessen Lava Geschwisterlichkeit, Solidarität, gegenseitige Unterstützung, Genossenschaftlichkeit, Opferbereitschaft, Liebe zum Volke und zur Heimat sprüht. Wir zerschmettern und verwischen den Schmutz des Egoismus, der Fäulnis und der Unmoral in ihren Köpfen.

DER KAMPF IST EIN KAMPF UM BROT

DIE FORDERUNG UNSERES VOLKES IST BROT UND GERECHTIGKEIT

Das amerikanische Imperium läßt die Weltvölker ohne Brot und Gerechtigkeit. Die Oligarchie der Türkei läßt ihr Volk ohne Brot und Gerechtigkeit. Diese Regierung bringt lediglich Unterdrückung und Hunger. Unser Volk wurde so weit gebracht, daß es heute nicht mehr imstande ist das trockene Brot, welches es gestern gegessen hat, zu kaufen.

Wie lange kann dieser Hunger, diese Ungerechtigkeit noch mit Tyrannei unterdrückt werden? Wie lange noch können sie die Rebellion der Hungernden und Verarmten mit Polizei und Armee aufhalten? Unser Volk muß sich sättigen. Es gibt keine einzige Kraft in der Welt, die eine solche Forderung unterdrücken kann.

GESCHWISTER! UNSER HUNGRIGES UND ARMES VOLK!

Wir müssen uns gegen das Unterdrückungssystem, welches von der Hilfsregierung des IMF aufgebaut wurde, organisieren. Wir müssen uns für Brot organisieren. Wir müssen uns für Gerechtigkeit organisieren. Wir können nicht ohne Brot und Gerechtigkeit leben.

Die 4 Gefallenen sind ein Aufruf zur Rebellion gegen den IMF, das US-Imperium und die pro-amerikanische Regierung.

Sie sind der Aufruf für ein Land, das nicht vom IMF regiert wird. Wenn wir Brot wollen, dann müssen wir uns vom IMF und seinen Kollaborateuren befreien.

Unser Widerstand ist der Aufruf für ein freies und unabhängiges System, in dem unser Volk in Satttheit lebt.

Wir werden dieses von unseren Gefallenen ersehnte System aufbauen.

UNSERE GEFALLENEN:

Zeynep ARIKAN GÜLBAG:

"Dieses Leben soll ihnen gewidmet sein!"

Im Jahre 1986 lernte sie Anhänger der Dev-Genc kennen. Sie machte einen Schritt vor in den Kampf. Unsere Genossin Zeynep befindet sich heute wie gestern im Kampf. Heute, sowie gestern hat sie auf vielen Gebieten des Kampfes Aufgaben übernommen. Sie war Führerin, Kommandantin. Am Vorabend des letzten großen Gefechts erklärte sie "Ich möchte nicht am Kampf teilnehmen sondern im Kampf ganz vorne stehen", und das ist ihr gelungen. Mit einer Bescheidenheit, die sagt "Ich versuche am 280. Tage des Todesfastens lediglich ein einfacher Soldat des Kampfes zu sein", ist sie als

Kommandantin und Symbol der Herausforderung von Zeit und Unterdrückung, der Willensstärke und Entschlossenheit unsterblich geworden. Unsere Genossin Zeynep wurde 1968 in Malatya Hekimhan geboren. Im Kindesalter ist sie mit ihrer Familie nach Istanbul verzogen. Zwischen 1986-87 lernte sie in der Universität zu Istanbul die Anhänger der Dev-Genc kennen. Und sie hat ihren Kampf von 1987 bis 1992 innerhalb von Dev-!

Genc geführt. Während dieser Zeitspanne ist sie mehrmals festgenommen worden. Sie wurde aufgrund eines Protests gegen das Massaker in Maras festgenommen und befand sich für eine Weile im Gefängnis von Bayrampasa. Sie übernahm Aufgaben innerhalb des Dev-Genc- Komitees. Sie arbeitete bei der Zeitung Mucadele. Mit Kazim Gülbag heiratete sie im März 1992. Die Bedingungen des Kampfes und die organisatorischen Bedürfnisse haben sie nach kurzer Zeit voneinander getrennt. Während sich Zeynep im Gefängnis von Ümraniye im Todesfasten befand, war Kazim Gülbag im Ausland. Er beteiligte sich am Widerstand, indem er seinen Körper in Brand steckte; Er hat seine Verbundenheit und Liebe zu seinen Genossen, seinem Volk und seiner Ehefrau gezeigt, indem er seinen Körper gegen die Unterdrückung einsetzte. Im Jahre 1993 wurde Zeynep seitens der Putschisten angeschossen. Zwischen 1995-96 befand sie sich zwecks Ausbildung auf verschiedenen Gebieten. Von 1996-1997 übernahm sie die Aufgabe als Kommando!

ndantin innerhalb der Bewaffneten Propagandaeinheiten in Istanbul. Sie setzte ihre Unterschrift unter Aktionen, bei denen die Volksjustiz gegen Folterer und Mörder umgesetzt wurde. Am 4. August 1997 wurde sie festgenommen und ins Gefängnis gesteckt. Als die Gefängnisse des Typ F an die Tagesordnung kamen, befand sie sich im Gefängnis von Ümraniye. Sie trat ins Todesfasten. Der 19. Dezember, die Folter Zwangsernährung, Bestechung der Freilassung folgten eine nach dem anderen. Sie liebte ihr Volk, war ihren Genossen verbunden und ihren Gefallenen treu. Sie hat nicht gezögert. Sie wurde unsterblich mit dem Glauben an den Sieg.

ALI RIZA DEMIR:

"Ich bin in einer Gemeinschaft, selbstlos und ohne Rücksicht auf den Tod"
Er wurde am 9. November 1973 als Kind einer armen Kurdischen Familie in dem Dorf Adiyaman-Gökçay (Karikan) geboren. Er kannte die Repression und die Unterdrückung aus seinem Dorf. Er war das Kind eines Volkes, dessen Sprache und Kultur verboten war. Nach Abschluß des Gymnasiums in Malatya trat er im Jahre 1991 das Fach Textilingenieurwesen an der Technischen Universität zu Istanbul an. Hier lernte er die Anhänger von Dev-Genc kennen. Er hat ohne zu zögern im organisierten Kampf teilgenommen. Denn er "wollte sein Wissen nicht in den Dienst des Systems stellen". Er war sich darüber bewußt, daß der Kampf gegen den Faschismus organisiertes Revolutionärtum bedeutete. Bis zu seiner Gefangenschaft im Jahre 1994 hat er innerhalb von Dev-Genc unterschiedliche Aufgaben übernommen. Als Kämpfer der 1. Todesfastengruppe im Gefängnis von Ümraniye ist er in seinem langen Rennen, das er mit den Worten "Wir rufen die Stimme unserer Genossen, die aus den Gefängnissen den Aufrufen des Feindes!

'sich zu ergeben' mit 'Wir werden eher sterben, als uns ergeben' antworteten, noch lauter hinaus. Mit unserer Todesfastenoffensive werden wir diese Fahne ein weiteres Mal auf der Festung des Feindes aufpflanzen" begonnen hat, 343 Tage ohne Atempause gelaufen. Er setzte den Widerstand nach seiner Freilassung fort. Seine Gefühle in diesen Tagen hat er folgenderweise zum Ausdruck gebracht: "Heute befinde ich mich innerhalb der großen Familie der Partei-Front, meiner Familie. Ich bin glücklich und stolz. Ich bin gefüllt mit Begeisterung und Freude. Ich befinde mich unter Genossen. Ich bin in einer Gemeinschaft, selbstlos und ohne Rücksicht auf den Tod, ich liebe diese Familie." Diese Familie liebt auch Ihn.

AYSE BASTIMUR:

"Was kann schöner sein als sich der Gewalt zu widersetzen?"
Sie wurde am 24. Januar 1967 in Balıkesir-Bigadic als Tochter einer Familie türkischer Herkunft und sunnitischen Glaubens geboren. Sie hat die Volks- und Mittelschule in Bigadic, das Gymnasium für den Medizinberuf in Balıkesir abgeschlossen und als Krankenschwester zu arbeiten begonnen. Sie war in verschiedenen Krankenhäusern in Istanbul tätig. Sie arbeitete in der Türkischen Krankenschwesternvereinigung. Ihre erste Bekanntschaft und Sympathie zu unserer Bewegung begann etwa im Jahre 1985.

Ab 1987 nahm sie innerhalb unserer organisierten Zusammenhänge teil. Nach eigenen Worten hat sie das organisierte revolutionäre Leben gewählt "weil sie daran glaubte, die Wahrheit gefunden zu haben". Sie übernahm Aufgaben innerhalb der Organisierung der Revolutionären Beamtenbewegung. Im Jahre 1988 wurde sie nach den 1. Mai Demonstrationen inhaftiert und verbrachte zweieinhalb Monate im Gefängnis von Bayrampasa. Nach ihrer Freilassung gab es schließlich eine Ayse die in ihrer Wahl für das Revolutionärtum noch klarer war. Bis zu ihrer Gefangennahme bei der Operation vom 16-17 April 1992 hat sie verschiedene spezielle Aufgaben in unserer Bewegung übernommen. Nach ihrer zweieinhalbjährigen Gefangenschaft in Bayrampasa wurde sie ins Gefängnis von Canakkale verlegt. Als der Isolationszellen-Angriff an die Tagesordnung kam, nahm sie in der 1. Todesfastengruppe im Gefängnis von Canakkale teil. Während sie sich freiwillig meldete erklärte sie: "Was kann es schöneres geben als sich der Gewalt zu widersetzen?" Am 19. Dezember gehörte sie zu denen, die sich der Folter durch Zwangseingriff entgegenstellten. Sie hat die Bestechung durch Freilassung zurückgewiesen und das "rote Band", welches sie auch draußen um ihre Stirn band, nicht abgeworfen. Denn sie hat an den Sieg geglaubt und gewußt, daß das einzige Mittel gegen Unterdrückung der Widerstand war. Dies hat sie in ihren letzten Worten folgendermaßen zum Ausdruck gebracht:
"Wir haben den Weg beschritten um zu siegen. Die Entwicklungen haben einen noch viel stärkeren Willenskampf erfordert als wir erwartet hatten. Ob nun vorbereitet oder unvorbereitet, es war unsere Ehrenpflicht dies in Kauf zu nehmen. Niemand soll daran zweifeln, die Tage unseres Sieges sind ganz nah." Wenn sie auch den Sieg nicht erleben konnte, so sah sie ihn vorher und sagte: "Schon jetzt feiere ich den Sieg unseres Volkes und der Weltvölker".

DEVRYMCY HALK KURTULUP CEPHESY
REVOLUTIONÄRE VOLKSBEFREIUNGSFRONT

Datum: 10. Oktober 2001 Erklärung: 215

Schluß mit der Lüge und Demagogie!
Jede auf Afghanistan abgeworfene Bombe ist der Beweis der Realität!
DIES IST EIN EROBERUNGSKRIEG!

Nach tagelanger Propaganda, Manövern, und Demagogien hat sich die amerikanische Kriegsmaschinerie in Bewegung gesetzt und begonnen, das Volk von Afghanistan zu bombardieren. Dabei war die Rede von Gerechtigkeit, unendlicher Freiheit und vom Anpassungskrieg; Alles gelogen. Mit diesen Diskussionen soll das Wesen des Angriffs verschleiert werden. Die USA bringen Tod und Hunger nach Asien. Die US-Operation ist ein offener, gegen die Weltvölker gerichteter Terrorangriff. Dieser Krieg, ist der Krieg der USA um die Weltmacht. Es ist der Krieg um das Imperium. Deshalb wird Afghanistan bombardiert. Deshalb werden Länder, Völker, Organisationen bedroht.

Schluß mit der Lüge und Demagogie!
Die USA Können Nicht Bestimmen, Wie Die Weltvölker Zu Leben Haben!
Die USA erklären 'Taliban wird dafür bezahlen, daß er nicht mit uns kollaboriert', und sagen damit ganz offen, wir werden dein Land in Schutt und Asche legen. Sie sagen 'Mir gefällt dein Regime nicht, ich werde es ändern'. Wo bleiben hier Demokratie, internationales Recht und Gerechtigkeit? Nichts davon ist zu sehen. Es ist absoluter Terror. Sie wechseln die Führungen: Um sie auszutauschen morden sie; die Überlebenden werden Armut und Hunger ausgesetzt, ohne ein Glas sauberes Wasser zu haben in Flüchtlingslager gesperrt. Wodurch wollen sie denn die Führung ersetzen, während sie mit Bomben und Raketen alles niederbrennen und massakrieren. Sie sagen "Hier habt ihr einen König!".

Die Realität: Jede Abgeworfene Bombe Dient Den Interessen Der Monopole. Das ist die imperialistische Demokratie. In der imperialistischen Demokratie gibt es keine Prinzipien; ihr einziges Prinzip sind die Interessen der

Monopole. Hierfür verteidigt sie auch die Monarchie und führt Militärputsche durch. War es nicht sie selbst, die Taliban an die Regierung gebracht hat? Damals stellten die Lebensweise von Taliban und sein Regime kein Problem für Amerika dar. Denn die damaligen Interessen der Monopole lagen darin, die UdSSR-nahe Regierung in Afghanistan umzustürzen. Es war für die USA zu keiner Zeit bedeutend, ob der Charakter des Regimes in Afghanistan oder das eines anderen Landes demokratisch ist oder nicht; das entscheidende ist für die USA, ob es sich dem Amerikanischen Imperium beugt oder nicht. Wenn es sich beugt, ist es ein gutes, wenn nicht dann ist es ein schlechtes Regime, das ausgetauscht werden muß. Das Amerikanische Imperium will den letzten Bissen des Volkes, die letzten Überreste der nationalen Willenskraft vernichten. Dies ist das Ziel des Eroberungskrieges. Sein Ziel ist; sich die ganze Welt untertänig zu machen.

Afghanistan Ist Die Tür Zur Eroberung Asiens

Die Hauptverantwortung für alle Gewalt auf der Welt trägt der US-Imperialismus, welcher der Welt sein Imperium aufzwingt. Er macht sich mit dem Vorwand Bin Ladin zu schnappen über die ganze Welt und die Völker lustig. Dies ist eine Operation zur Eroberung, mit der die Märkte Asiens und die Welt erbeutet werden sollen.

Das Imperium führt daran vorbei, den Mittleren Osten, den Balkan und Asien zu erobern. Der Angriff der mit Irak begann und mit Jugoslawien fortgesetzt wurde, richtet sich nun gegen Afghanistan. Weil dem so ist, haben die USA von Beginn an von einer langen Dauer dieses Krieges gesprochen; es ist wahrhaft nicht leicht, Asien und die Welt zu erobern. Der Asiatische Markt, der große Chinesische Markt, die ehemaligen Sowjetländer blenden die imperialistischen Monopole. Die Kriegsmaschinerie Amerikas hat sich in Bewegung gesetzt, um die Erdöllager in diesen Regionen zu beschlagnahmen. Dies ist der ganzen Welt bekannt. Schluß mit der Lüge und Demagogie. Der Angriff auf Afghanistan ist der größte und sichtbarste Zustand der imperialistischen Gewalt.

NATO, EU, UN Haben Sich An Amerika Festgeklammert!

Die USA haben damit begonnen, ihren Plan, Afghanistan zu bombardieren und sich von dort aus in ganz Asien auszubreiten in die Praxis umzusetzen. Die USA erklären den anderen Imperialisten gegenüber, daß sie dies mit oder ohne ihre Beteiligung tun werden. Die EU hat sich beteiligt, um nicht ein Außensteher dieser Ausbeutung und Plünderung zu sein. So war dies schon beim Angriff auf Irak und Jugoslawien.

Die anderen Imperialisten besitzen weder die Kraft, dies zu verhindern noch die Vorreiterrolle zu übernehmen. Innerhalb dieses Kräftegleichgewichts, haben die USA NATO, EU und UN benutzt, um ihren Angriff zu legitimieren und die NATO den Beschluß fassen lassen, Artikel 5 in Anwendung zu bringen. Den Angriff führen sie im Grunde mit ihren eigenen Kräften durch.

Die Quelle Der Gewalt Ist Amerika Und Sein System.

Die gesamte Geschichte der USA ist gefüllt mit Massakern, Besetzungen, dunklen Geschäften, Attentaten, Komplotten. Sind nicht auch Taliban und Bin Laden, gegen die heute der Krieg geführt wird, jene Kräfte, die mit Unterstützung der USA ins Leben gerufen wurden?

Es sind die USA, die Militärputschs durchführen und Konterguerillaorganisationen aufbauen. Speziell für die Massaker und Militärjuntas, die vom 2. imperialistischen Verteilungskrieg bis in die Gegenwart verwirklicht wurden tragen die USA die Hauptverantwortung. Dieses System wurde für die Ausbeutung und Plünderung der Monopole aufgebaut. Die Bomben sind dessen offenste Erscheinung. Neben jenen, die durch Hunger und Armut getötet werden, stellen die durch Bomben Ermordeten nur einen geringen Anteil dar. Kapitalismus tötet durch Hunger. Dutzende von Institutionen veröffentlichen Statistiken. Die Weltvölker HUNGERN! Und wer läßt sie hungern?

Brot und Gerechtigkeit ist das Recht aller Völker. Wer dieses Recht raubt, ist auch verantwortlich für jede Form von Gewalt. Auf diese Weise wird Gewalt produziert. Den Kindern, die im Kugelhagel aufwachsen und den Völkern die inmitten von Bomben, Raketen und Hungersnot leben müssen, bleibt keine andere Wahl als für Brot und Gerechtigkeit Widerstand zu leisten und zu kämpfen.

Die Völker Besitzen Widerstandskraft Gegenüber Den Besetzern!

Auch die Völker, deren Brot und Gerechtigkeit geraubt werden sagen gegenüber diesem Zwang; 'wir entscheiden selbst, wie wir zu leben haben; auch wir haben das Recht zu regieren. Um dieses Recht in Anspruch zu nehmen, ist es auch unser legitimes Recht Widerstand zu leisten'.

Der Zorn der Weltvölker auf die USA ist nun noch größer geworden. Diese Wut wird sich in ganz unterschiedlichen Formen gegen die USA wenden.

Auch die Behauptung, die ganze Welt stünde auf der Seite der USA ist ein Teil der Demagogie. Es hat nicht allzugroße Bedeutung, ob so und so viele Länder oder so und so viele Regierungen ohne ausgeprägte Persönlichkeit mit den USA kollaborieren. Die Welt der Armen, Hungernden, Unterdrückten ist gegen die USA; und selbst wenn der Preis dafür Raketen und der Tod sind, stellen sie sich gegen eine Kollaboration mit den USA und gegen die Komplizenschaft in dem Krieg Amerikas. Die armen Völker Asiens werden sich den Amerikanischen Raketen nicht beugen.

Die Regierung Kann Das Volk Der Türkei Nicht Vertreten! Unser Volk Steht Auf Der Seite Der Unterdrückten Völker. Wir Sind Auf Der Seite Des Afghanischen Volkes!

Die Haltung der Regierung unseres Landes gegenüber dem Angriff der USA auf Afghanistan ist schändlich. Eine Regierung, die sich seriös zu zeigen versucht, indem sie in völliger Knechtschaft und Unterwerfung hinter den USA herzieht und um die bessere Dienerschaft wetteifert, damit sie vom IMF einige Millionen Dollar mehr bekommt, kann unser Volk und unser Land nicht vertreten.

Der Ministerrat fällt den Beschluß, daß Protestaktionen gegen den Krieg nicht zugelassen werden können. Sie sind noch royalistischer als der König selbst. Sogar in den USA werden Protestaktionen gegen den Krieg abgehalten, aber sie zögern nicht dabei, ihre Knüppel gegen das eigene Volk einzusetzen, es mit Panzern zu überfahren und zu beschießen, um die Proteste gegen ihre Könige zu verhindern.

Amerika! Raus aus Asien, aus dem Mittleren Osten und der Welt!

Amerikaner; begeht Euch nach Hause!

Auch wenn alle Imperialisten, faschistischen Diktatoren, kollaborierenden und Lakaienregime auf Eurer Seite stehen, habt ihr die größte Kraft der Welt, die Kraft, welche die Welt aufrecht erhält, DIE WELTVÖLKER gegen euch. Euer Traum vom Imperium wird auf den Widerstand der Völker prallen und sich zu einem Alptraum wenden. Jedes Gebiet nach dem Amerika seine Hand ausstreckt wird am Ende zu einem Vietnam werden.

Schluß Mit Der Lüge Und Demagogie!

Alle, Die Die Realität Sehen, Müssen Sich Dem Amerikanischen Imperium Widersetzen!

Wir stehen einem Zwang gegenüber, der sagt 'Die ganze Welt muß sich vor mir beugen, die ganze Welt soll meine Gedanken, meine Ideologie meine Lebensweise akzeptieren; die ganze Welt wird produzieren jedoch nicht konsumieren, und die Früchte der Arbeit werde ich aufessen.' Die USA führen einen absoluten Krieg zur Kapitulation in sowohl ökonomischer, militärischer als auch politischer Hinsicht. In diesem Amerikanischen System sind die Völker HUNGRIG, besitzen Völker und Länder keinen eigenen WILLEN. In diesem Amerikanischen System, besitzen die Völker keine Nationalen Identitäten, Kulturen und Rechte. Auf einer solchen Welt existieren weder Brot noch Gerechtigkeit. Diese, den Völkern keinerlei Achtung schenkende imperialistische Politik, ist die Quelle der Gewalt.

Es ist unmöglich, daß eine Politik wie diese keine Gewalt produziert. Alle Völker der Welt werden gegen das Amerikanische Imperium FÜR BROT UND GERECHTIGKEIT Widerstand leisten und kämpfen. Es gibt für die Völker keinen anderen Weg.

=====
04 Wochentliche ATTAC-Info (41. Woche)

von: ATTAC Österreich, infos@attac-austria.org
=====

1. Erfolg der Aktionen zum Thema Steueroasen am 5. und 6. Oktober
2. 15.10. Attac Treffen Salzburg
3. 19.10. Terminerinnerung Reichtumskonferenz
4. 5.11. Gründung Attac Kärnten
5. 6.11. Start unseres monatlichen ForumAttac in Wien
6. 10.11. WTO Konferenz in Linz
7. 10.11. Ein Jahr ATTAC - Geburtstagsparty ebenfalls in Linz

1. STEUEROASE AKTION im Graben

War ein Erfolg! Nicht nur österreichische Medien waren interessiert, sondern auch internationale (z.B. Reuters). Fotos von unserer Steueroase könnt ihr nicht nur auf unserer Homepage <http://www.attac-austria.org/fotos/oase/oase.php> bewundern, sondern auch in verschiedenen Medien (z. B: Standard und Kurier vom 6.10, Profil 8. Oktober). Weiters gab es eine internationale Aktion in Luxemburg, viele AktivistInnen waren dort, die Infostände wurden gut besucht, Fotos unter www.attac.org/luxembourg.

Der Terror-Anschlag vom 11. September hat die Diskussion über Steueroasen und Geldwäsche ins Licht der Öffentlichkeit gerückt. So ist in der heutigen Ausgabe der Süddeutschen Zeitung ist das Thema des Tages "Konten sperren statt Krieg führen" und in der Einleitung ist zu lesen: ... "Terroristen nutzen offenbar oft dieselben Strukturen im internationalen Finanzsystem wie Geldwäscher. Sie eröffnen zum Beispiel Bankkonten von Scheinfirmen in Geldwäsche-Paradiesen, um Spuren zu verwischen. Die Arbeit der Ermittler wird in beiden Fällen durch die Existenz anonymer Konten erschwert....

Der ganze Text ist zu lesen auf:

http://szonnet.diz-muenchen.de/REGIS_A13152257

2. Attac Treffen in Salzburg

Am 15. 10. um 18.30 ist im Salzburger Brunauerzentrum das erste Herbsttreffen. Dabei sollen die inhaltlichen Schwerpunkte festgelegt werden und über bereits konkret geplantes diskutiert werden.

InteressentInnen kontaktieren Robert Müllner: auge.sbg@demut.at

Die Salzburger ATTAC-Gruppe ist Mitorganisatorin der Veranstaltungsreihe (9.11., 19.11., 7.12.) zum Thema: Seattle-Salzburg-Genua. Globalisierungsprotest und die Gewaltfrage des Salzburger Friedensbüros. Die erste prominent besetzte Veranstaltung findet am 9.11. um 18.00 h statt.

Weitere Informationen folgen und sind in Kürze auf der Seite von ATTAC-Salzburg zu lesen.

3. Terminerinnerung: Reichtumskonferenz

Am 19./20. Oktober 2001 findet die Reichtumskonferenz mit einem spannenden Programm statt, ATTAC ist Mitorganisator. Das Programm findet ihr auf <http://www.attac-austria.org/termine/reichtumskonferenz.php>, Anmeldung und Infos bei: armutskonferenz@akis.at

4. Gründung von ATTAC - Kärnten

Am 5. November ist es auch in Kärnten soweit! ATTAC Kärnten wird gegründet. Und zwar im Rahmen einer Veranstaltung (u.a. mit Bischof Herwig Sturm "Die Welt- ein Casino? Ethische Problem unter dem Einfluss der Finanzmärkte") um 19.00 im Gemeindezentrum St.Ruprecht, in der St. Ruprechterstraße in Klagenfurt. Genauere Details werden nächste Woche bekanntgegeben.

InteressentInnen melden sich bei Walther Schütz: buendnis.oeie@aon.at

5. ForumAttac startet am 6. November

ForumAttac ist unser neuer, monatlicher Treffpunkt für ATTAC-Mitglieder und Interessierte und solche, die es noch werden wollen. Wirkliche statt virtuelle Kommunikation, Gemütlichkeit statt Aktionsstress, zum Kennenlernen für Interessierte; Informationen zu aktuellen Themen, Aktionen,...in Verbindung mit musikalischen Events (DJ, Jazz, Blues. Wer hat Ideen?) oder einfacher Beisl-Athmosphäre

6. November, 19.00 im Depot (Breite Gasse 3, 1070 Wien, hinter Museumsquartier);

Thema: Informationen zum Thema Welthandelsorganisation (WTO) anlässlich der Ministerkonferenz in Qatar und der ATTAC-Konferenz in Linz.
Einleitungsstatement: Christian Felber, ATTAC Österreich

6. WTO KONFERENZ, 10. November Linz

In einem Monat ist es wieder soweit! Nach dem Scheitern der letzten WTO Konferenz in Seattle, findet diese Konferenz an einem Ort statt, wo es kein Demonstrationsrecht gibt! (Doha in Qatar vom 9-13. November). Zudem stehen auf der Agenda nicht nur die Bereiche Gesundheit, Bildung oder Wasserversorgung: Auf Initiative der EU-Kommission gelangt das Thema Investitionen auf die Tagesordnung, was voraussichtlich das berüchtigte Investitionsschutzabkommen MAI wiederbelebt. Nicht zuletzt deshalb finden in ganz Europa Kongresse, alternative Gipfel, Demonstrationen, Aktionen... statt, die eine andere Globalisierung fordern. Zudem werden diese Aktionen gegenüber den Medien von SOS-WTO-EU europaweit koordiniert.

Wir sind natürlich auch dabei: Mit dem Kongress zum Thema "Die Welt ist keine Ware - Qatar/Linz 2001" am 10. November in Linz (Volkshaus Dornach) den ganzen Tag ab 10.00 gemeinsam mit Greenpeace, Dreikönigsaktion, ÖGB Oberösterreich und anderen Organisationen.

Das Gesamtprogramm mit allen Infos wird am Montag getrennt ausgesandt und ist ab dann auch auf unserer Homepage. Wir freuen uns auf zahlreiche Teilnahme!

Im Anschluss an diese Veranstaltung findet am Abend

7. UNSERE GEBURTSTAGSFEIER

statt: ATTAC Österreich ist 1 Jahr alt geworden und beginnt dieses Fest

der Straße Workshops, Diskussionsrunden und Aktionen zu diesem Thema stattgefunden. Sowohl gemeinsam mit PolitikerInnen, als auch mit ReferentInnen der SchülerInnenvertretung, der AKS und der ÖH diskutierten SchülerInnen über die derzeitige Bildungspolitik und Reformen im Schulwesen und machten durch kreative Aktionen auf der Straße auf ihre Anliegen aufmerksam.

"Der Staat zieht sich immer weiter aus der Verantwortung zurück und gewährt marktwirtschaftlichen Prinzipien von Konkurrenzdenken und Leistungsdruck mehr und mehr Einzug in das Schulwesen. Die Schule sollte selbstdenkende, kritische Persönlichkeiten heranbilden, anstatt der Wirtschaft den vorgeformten Produktionsfaktor Mensch in die Hand zu spielen! Bildung ist Menschenrecht und keine Ware zum Verkauf!", so der AKS-Bundesvorsitzende.

Der 11. Oktober ist gleichzeitig der Startschuss der neuen AKS-Kampagne, die unter demselben Motto auf die Missstände in österreichs Schulen und den neo-konservativen Tenor von österreichs Bildungspolitik aufmerksam machen will. "Die gestrige Präsenz der SchülerInnen stellt einen großen Motivationsschub für unsere Arbeit dar. Wir werden weiterhin unserem Unmut Ausdruck verleihen - die Bildungsministerin kann die Anliegen der SchülerInnen nicht ewig ignorieren.", schließt Kowall.

Rückfragehinweis: Niki Kowall 0699/11408142

=====
07 Depot Programm in der Woche 15. bis 19.10.01
von: depot <koestring@depot.or.at>

=====
Sehr geehrte Damen und Herren, liebe FreundInnen und PartnerInnen des Depot,

in der Anlage finden Sie das Programm des Depot für die kommende Woche.

Wir freuen uns auf Ihr Kommen.

Ein wichtiger Hinweis: Die für Donnerstag, den 18. Oktober geplante Veranstaltung "Luxus - Ökonomie. Feministische Wirtschaftsmodelle" der feministischen Medien wurde leider abgesagt.

Depot-Team

Montag, 15. Oktober, 19.00
Bewegte Männer
Rosa Logar im Gespräch mit Erich Lehner und Stephan Schulmeister

Ist eine politische Umsetzung der Ziele des Feminismus nur möglich, wenn sie von Frauen vorangetrieben werden? Zum Auftakt einer Depot-Reihe über die Zukunft des Feminismus sitzen unter der Moderation von Rosa Logar zwei Männer auf dem Podium: Erich Lehner und Stephan Schulmeister sprechen über den Stellenwert des Feminismus aus dem Blickwinkel ihrer Disziplinen, über Formationen der Abschottung, über Innen- und Außensicht. Ist die Frauenbewegung mittlerweile eine gesellschaftliche Schutzzone geworden und wie funktionieren im Vergleich dazu Männervereinigungen?

Erich Lehner, Theologe, Männer- und Geschlechterforscher, Ludwig Boltzmann-Institut für Werteforschung, Wien.
Stephan Schulmeister, Österreichisches Institut für Wirtschaftsforschung (WIFO), Wien.
Rosa Logar, Geschäftsführerin der Interventionsstelle gegen Gewalt, Wien.

Dienstag, 16. Oktober, 19.00

Podiumsdiskussion
Elektronische Demokratie?

Unter welchen Bedingungen könnte Online Voting sinnvoll sein und zwar nicht nur, um die technische Durchführung demokratischer Wahlen zu vereinfachen, sondern auch, um die Demokratie zu stärken? Durch die Einbindung der User in Communities und Wahlbörsen könnte sich die Möglichkeit einer höheren Wahlbeteiligung ergeben, wenn der technological gap zwischen Usern und Non-Usern überwunden werden kann.

Die Aktion Vote-Auction (www.voteauction.at) der Gruppe übermorgen, hat vor einem Jahr für die Wahlprozeduren in den USA eine "Vereinfachung" vorgeschlagen; eine Verbindung von Demokratie und Kapitalismus sollte direkt den WählerInnen zukommen.

Katharina Gsöllpointner, Kunst-, Kultur- und Medientheoretikerin, Wien.
lizvlx und hans_extrem, KünstlerInnen der Gruppe übermorgen, Wien.
Gregor Matjan, Politikwissenschaftler, Institut für Politikwissenschaft der Universität Wien.

08 INTERFACE EXPLORER 18./19. Oktober 2001 -> 2nd Announcement
von: Martin Wassermair <wassermair@t0.or.at>
=====

|---
VERANSTALTUNGSANKÜNDIGUNG pt.2
Public Netbase Media~Space!
Institut für Neue Kulturtechnologien/t0

|---
| INTERFACE EXPLORER
| Shared Boundaries
|
<http://interface.t0.or.at/>

|---
| Ein Public Netbase Event im "Zwischenquartier" mit:
|
| Markus Bader/DE, Jonah Brucker-Cohen/US, Matthew Fuller/UK,
| Patricia Futterer/AT, Mieke Gerritzen/NL, Johannes Grenzfurthner/AT,
| Graham Harwood/UK, Margarete Jahrmann/AT, Joes Koppers/NL , Christoph
| Kummerer/AT, Pär Lannerö/SE, Lev Manovich/US/RU, Max Moswitzer/AT,
Peter Purgathofer/AT, Gebhard Sengmüller/AT, Stijn Slabbinck/BE

|---
18./19. Oktober 2001, jeweils ab 19 Uhr

Die Veranstaltung thematisiert den Umgang mit Interfaces (Deutsch: Verbindung, Schnittstelle, Zwischenstück) und versucht, ihre Vielseitigkeit im Zusammenhang mit neuen Informationstechnologien zu erklären. Dabei beschränkt sich der Blick nicht auf einen theoretischen Diskurs, sondern er sucht auch ganz bewusst einen spielerischen Zugang. Neben der Präsentation einer Reihe von PC- und Web-Interfaces werden auch Arbeiten von KünstlerInnen vorgestellt, die sich diesem Thema auf allgemeinere Art annähern und eigene sowie auch eigenwillige Umsetzungen erarbeiten.

Lev Manovich, ein bedeutender Theoretiker der Neuen Medien, beschreibt in seinem aktuellen Buch "The Language of New Media" die kulturelle Dimension der digitalen Technologien und die Entwicklung der neuer Mensch/Maschine-Interfaces. Er wird im Rahmen seines Vortrags am 18. Oktober einige Grundlagen des kulturellen elektronischen Interfaces vorstellen und nicht nur Software-Kultur, sondern auch Kultur als Software begreifbar machen.

Am 19. Oktober folgt ein Panelgespräch zum Stand der Entwicklung kultureller Interfaces. ExpertInnen und EntwicklerInnen diskutieren dabei die gegenwärtig vorhandenen Ansätze im Interface Design. Mieke Gerritzen von NL.Design war eine der BegründerInnen des Internationalen Browserday, der vor 4 Jahren erstmals in Amsterdam und zuletzt in New York veranstaltet wurde, um Alternativen zu den bestehenden Web-Browsern aufzuzeigen. Zwei Gewinner der Browserday Awards - Joes Koppers (NL) und Jonah Brucker-Cohen (US) - werden ihre Projekte selbst vorstellen.

Die Künstler Harwood/Fuller beschäftigen sich seit langem mit den sozialen und sozio-kognitiven Aspekten der digitalen Informationsinteraktion. Sie präsentieren mit "TEXT-FM" ein text-to-speech-to-radio Projekt, bei dem über SMS anonyme Mitteilungen von einem Mobiltelefon gesendet werden und ein Computer einen über Sprache vermittelten Informationsaustausch ermöglicht.

Die Präsentationen und Installationen zeigen die Einbeziehung von Audio- und Videosystemen in das elektronische Interface - von Scratchrobot, TimeCodeVinyl, VinylVideo und Climax-Action Bot Concert bis hin zu webgesteuerter Discokugel-Musik und Musical Web-Pads.

| Ausstellung der INTERFACE EXPLORER Installationen bis Freitag,
| 9. November 2001 im Public Netbase Zwischenquartier
Geöffnet: Montag bis Freitag, von 14.00 bis 19.00 Uhr.

09 In den Fängen des Dr. Gross
von: augustin <augustin@nexta.at>
=====

In den Fängen des Dr. Gross
Eine Veranstaltung am Dienstag, 16. Oktober
im Aktionsradius Augarten

Mit skandalöser Verspätung hat nun der Bund Sozialdemokratischer Akademiker (BSA) eine Aufarbeitung des Falles Heinrich Gross in Auftrag gegeben. BSA-Präsident und Wiens Vizebürgermeister Sepp Rieder gestand dieser Tage, es sei ein Fehler gewesen, die Frage der BSA-Mitgliedschaft des berüchtigten NS-Arztes auf dem Spiegelgrund nicht offensiver angegangen zu sein. Nun ist Wolfgang Neugebauer, Leiter des Dokumentationsarchivs des Österreichischen Widerstands, mit einer Untersuchung beauftragt worden. Bereits im Juni hatte die Führung der Ludwig-Boltzmann-Gesellschaft um Verzeihung gebeten. Die Gesellschaft hatte dem NS-Arzt - man wirft ihm mehrfachen Mord an geistig behinderten Kindern vor - Unterschlupf gewährt und ihn mit einem Gehirnforschungsinstitut versorgt. Hätten nicht der Journalist Oliver Lehmann und die Zeitgeschichtlerin Traudl Schmidt mit ihrem Buch "In den Fängen des Dr. Gross" (Czernin Verlag) die Öffentlichkeit aufgewühlt - der braune Fleck im BSA wäre wohl weiter nicht angegangen worden. Oliver Lehmann wird im Aktionsradius Augarten sein Buch vorstellen und über die Lawine berichten, die er damit losgetreten hat. Die Wiener Ärztin Dr. Karin Mosser, Leiterin des Gedenk- und Forschungsprojekts in der Causa Gross (im Auftrag der Gemeinde Wien), wird über die Pläne der Errichtung einer Gedenkstätte auf dem Baumgartner Höhe und der Bestattung der Hirne der ermordeten Kinder berichten. Einige Überlebende vom Spiegelgrund werden für Anfragen zur Verfügung stehen.

Ort: Wien 20, Gaußplatz 11
Beginn: 19:30. Eintritt frei.

=====
10 1 Jahr Todesfasten in der Türkei
von: PWI <info@pwi.action.at>
=====

An die demokratische Öffentlichkeit!

Das gestrige Koordinationstreffen hat für den Jahrestag des Todesfastens der politischen Gefangenen in der Türkei und ihrer Angehörigen folgendes beschlossen:

SOLIDARITÄTSDEMONSTRATION

Ort: Europaplatz/Westbahnhof
Datum: Samstag, 20. Oktober 2001
Zeit: 14.00 Uhr

Die bisherigen UnterstützerInnen sind:
AIK - Antiimperialistische Koordination
RKL - Revolutionär Kommunistische Liga
BsB - Bewegung für soziale Befreiung
Rat zur Verteidigung des Kampfes der iranischen Völker
ÖZTUDAK - TIKB
TAYAD - Solidaritätskomitee Wien
DHKC Wien

Satire

Satire (v. lat.: *Satura* = satt, fruchtbar, voll; in Verbindung mit lat. *lanx* = Schüssel: eine mit allerlei Früchten buntgefüllte Schale) ist ursprünglich eine **Spottdichtung**, ein boshaft-kritisches, spöttisch-humoriges **Gedicht**, zusammengesetzt aus gemischten Elementen und mit gewissem Tiefgang zum Nachdenken verfasst.

Der Begriff geht zurück auf die Spottverse des römischen Dichters **Lucilius** (ca. 180-102 v. Chr.), die eine **Emanzipation** von der bis dahin griechisch geprägten Dichtkunst markierten. Anfangs als "Sermones" bezeichnet, stehen in den ersten drei Jahrhunderten beide Begriffe nebeneinander, bis sich mit dem boshaften Schriftenzyklus aus 16 Satiren von **Juvenal** (ca. 60-140 n. Chr.) der Begriff "Satire" endgültig durchsetzt.

Ursprünglich also in der **Literatur** entstanden, hat sich die Satire nach der Entwicklung von **Film**, **Fernsehen** und **Rundfunk** auch in diesen modernen Medien etabliert. Die Filmsatire bedeutet demnach ein filmisches Allerlei, eine Mixtur aus unterschiedlichen Elementen mit dem Ziel einer spöttischen **Kritik** an bestehenden Zuständen. Das heißt: Die Satire - ob literarisch oder filmisch - will Missstände und Unsitten innerhalb der Gesellschaft, aber auch bestimmte Ereignisse und Personen anprangern, kommentieren und entlarven. Satire ist also Zeitkritik mit erzieherischer Tendenz, und ihr Verständnis darum auch stets an das soziale und historische Umfeld ihrer Entstehung gebunden.

Elemente und Stilmittel

Als **Stilmittel** bedient sich die Satire einer extremen Übertreibung, sehr häufig auch einer Übertretung der Grenzen dessen, was vom Publikum als "guter Geschmack" empfunden wird. Sie verfremdet einen Sachverhalt, hebt Widersprüche in übertriebener und ironischer Weise hervor, stellt kritisch gegenüber, verzerrt einseitig die angeprangerten Zustände und gibt sie der Lächerlichkeit preis, stellt bloß und setzt herab. Dies geschieht meist aus einer einseitig-subjektiven Sichtweise des Autors heraus.

Offt wird eine Person, eine gesellschaftliche Gruppe oder ein gesellschaftlich-kultureller Trend zur Zielscheibe des Satirikers. Dieser erklärt z.B. ein von ihm auserkorenes Opfer zum Gegner, den er glaubt, mit Worten lächerlich machen und herabwürdigen zu dürfen. Insofern wohnt der Satire ein höchst aggressives Potential inne. In seiner einseitig-subjektiven Sichtweise prangert der Verfasser einer Satire also das an, was er für falsch und unerträglich, was er in seinen Augen für ein individuelles oder gesellschaftliches Fehlverhalten hält.

Zitate

- "Satire: a poem in which wickedness or folly is censured." (Definition von **Samuel Johnson**)
- "Satirisch ist der Dichter, wenn er die Entfernung von der Natur und den Widerspruch der Wirklichkeit mit dem Ideale (in der Wirkung auf das **Gemüt** kommt beides auf eins hinaus) zu seinem Gegenstande macht. Dies kann er aber sowohl ernsthaft und mit Affekt als scherzhaft und mit Heiterkeit ausführen; Je nachdem er entweder im Gebiete des Willens oder im Gebiete des Verstandes verweilt. Jenes geschieht durch die strafende oder pathetische, dieses durch die scherzhafte Satire." (**Friedrich Schiller**)
- "Die Satire muss übertreiben und ist ihrem tiefsten Wesen nach ungerecht. Sie bläst die Wahrheit auf, damit sie deutlicher wird, und sie kann gar nicht anders arbeiten als nach dem Bibelwort: Es leiden die Gerechten mit den Ungerechten. [...] Was darf die Satire? Alles." (**Kurt Tucholsky**)
- "Satire ist die Kunst, einem anderen so auf den Fuß zu treten, dass er es merkt, aber nicht aufschreit." (**Helmut Qualtinger**)
- "Difficile est, saturam non scribere" (Es ist schon schwer, nicht Satiren zu schreiben) (**Juvenal**)
- "Applaus allein genügt nicht!" (**Rudolf Rolf**s)

Satire

Satire (v. lat.: *Satura* = fully, fruitfully, fully; in connection with lat. *lanx* = dish: a bowl multicolored-filled with all kinds of fruits) is originally mockery a seal, a malicious-critical, spoettisch humoriges poem, compound up from mixed elements and with certain depth written for thinking.

The term goes back on the mockery verses of the Roman poet Lucilius (approx. 180-102 v. Chr.), which marked a Emanzipation of up to then the Greek coined/shaped dichtkunst. At the beginning of as "Sermones" designation, both terms stand next to each other, to itself with the malicious writing cycle from 16 satires of Juvenal in the first three centuries (approx. 60-140 n. Chr.) the term "satire" finally intersperses.

Originally thus in the literature developed, the satire was established after the development of film _television and broadcast also in these modern media. The film satire therefore means a cinematic potpourri, a mixture from different elements with the goal of a spoettischen criticism at existing conditions. That means: The satire - whether literarily or cinematic - wants bad states and Unsitten within the society, in addition, determined events and persons anprangern, commentate and expose. Satire is thus time criticism with educational tendency, and its understanding therefore also always to the social and historical surrounding field of their emergence bind.

Elements and style means

When style means avails itself the satire of an extreme exaggeration, very frequently also an infringement of the borders its that by the public as "good taste" is felt. It verfremdet circumstances, emphasizes contradictions in exaggerated and ironical way, confronts critically, distorted on one side the anprangerten conditions and gives it the ridiculousness price, exposes and lowers. This happens usually from a one-sided-subjective aspect of the author out.

Often become a person, a social group or a social-cultural trend the target of the Satirikers. This explains e.g. a victim auserkorenes of it as the opponent, whom ridiculous he believes to be allowed to do with words makes and down-worthy. To that extent a most aggressive potential is inherent in to the satire. In its one-sided-subjective aspect the author of a satire prangert thus on, which he for wrong and intolerably, which he regards in his eyes as an individual or social failure.

Quotations

- "satire: A poem in which wickedness or folly is censured." (definition of Samuel Johnson)
- "Satirisch is a poet, if he makes the distance of nature and the contradiction of the reality with the ideal (in the effect on the mind both comes on one outside) his article. It can implement this however both seriously and with affect and jokeful and with amusement: ever after it stays either in areas of the will or in areas of the understanding. That one takes place by means of the punishing or pathetische, this with the jokeful satire." (Friedrich Schiller)
- "the satire must exaggerate and is unfair after its deepest nature. It blows the truth up, so that it becomes clearer, and it cannot work at all differently than after the Bible word: The fair ones with the unfair ones suffer [...] which may do the satire? Everything." (Kurt Tucholsky)
- "satire is the art to step another in such a way on the foot that it notices it, but does not cry out." (Helmut Qualtinger)
- "Difficile est, saturam non scribere" (it is already heavy not to write satires) (Juvenal)
- "applause alone is not sufficient!" (Rudolf Rolf)

Satire

Satire (v. *lat.*: *Satura* = satt, fruchtbar, voll; in Verbindung mit *lat.* *lanx* = Schlüssel: eine mit allerlei Früchten buntgefüllte Schale) ist ursprünglich eine **Spottdichtung**, ein boshaft-kritisches, spöttisch-humoriges **Gedicht**, zusammengesetzt aus gemischten Elementen und mit gewissem Tiefgang zum Nachdenken verfasst.

Der Begriff geht zurück auf die Spottverse des römischen Dichters **Lucilius** (ca. 180-102 v. Chr.), die eine **Emanzipation** von der bis dahin griechisch geprägten Dichtkunst markierten. Anfangs als "Sermones" bezeichnet, stehen in den ersten drei Jahrhunderten beide Begriffe nebeneinander, bis sich mit dem boshaften Schriftzyklus aus 16 Satiren von **Juvenal** (ca. 60-140 n. Chr.) der Begriff "Satire" endgültig durchsetzt.

Ursprünglich also in der **Literatur** entstanden, hat sich die Satire nach der Entwicklung von **Film**, **Fernsehen** und **Rundfunk** auch in diesen modernen Medien etabliert. Die Filmsatire bedeutet demnach ein filmisches Allerlei, eine Mixtur aus unterschiedlichen Elementen mit dem Ziel einer spöttischen **Kritik** an bestehenden Zuständen. Das heißt: Die Satire - ob literarisch oder filmisch - will Missstände und Unsitten innerhalb der Gesellschaft, aber auch bestimmte Ereignisse und Personen anprangern, kommentieren und entlarven. Satire ist also Zeitkritik mit erzieherischer Tendenz, und ihr Verständnis darum auch stets an das soziale und historische Umfeld ihrer Entstehung gebunden.

Elemente und Stilmittel

Als **Stilmittel** bedient sich die Satire einer extremen Übertreibung, sehr häufig auch einer Übertretung der Grenzen dessen, was vom Publikum als "guter Geschmack" empfunden wird. Sie verfremdet einen Sachverhalt, hebt Widersprüche in übertriebener und ironischer Weise hervor, stellt kritisch gegenüber, verzerrt einseitig die angeprangerten Zustände und gibt sie der Lächerlichkeit preis, stellt bloß und setzt herab. Dies geschieht meist aus einer einseitig-subjektiven Sichtweise des Autors heraus.

Offt wird eine Person, eine gesellschaftliche Gruppe oder ein gesellschaftlich-kultureller Trend zur Zielscheibe des Satirikers. Dieser erklärt z.B. ein von ihm auserkorenes Opfer zum Gegner, den er glaubt, mit Worten lächerlich machen und herabwürdigen zu dürfen. Insofern wohnt der Satire ein höchst aggressives Potential inne. In seiner einseitig-subjektiven Sichtweise prangert der Verfasser einer Satire also das an, was er für falsch und unerträglich, was er in seinen Augen für ein individuelles oder gesellschaftliches Fehlverhalten hält.

Zitate

- "Satire: a poem in which wickedness or folly is censured." (Definition von **Samuel Johnson**)
- "Satirisch ist der Dichter, wenn er die Entfernung von der Natur und den Widerspruch der Wirklichkeit mit dem Ideale (in der Wirkung auf das **Gemüt** kommt beides auf eins hinaus) zu seinem Gegenstande macht. Dies kann er aber sowohl ernsthaft und mit Affekt als scherzhaft und mit Heiterkeit ausführen; je nachdem er entweder im Gebiete des Willens oder im Gebiete des Verstandes verweilt. Jenes geschieht durch die strafende oder pathetische, dieses durch die scherzhafte Satire." (**Friedrich Schiller**)
- "Die Satire muss übertreiben und ist ihrem tiefsten Wesen nach ungerecht. Sie bläst die Wahrheit auf, damit sie deutlicher wird, und sie kann gar nicht anders arbeiten als nach dem Bibelwort: Es leiden die Gerechten mit den Ungerechten. [...] Was darf die Satire? Alles." (**Kurt Tucholsky**)
- "Satire ist die Kunst, einem anderen so auf den Fuß zu treten, dass er es merkt, aber nicht aufschreit." (**Helmut Qualtinger**)
- "Difficile est, saturam non scribere" (Es ist schon schwer, nicht Satiren zu schreiben) (**Juvenal**)
- "Applaus allein genügt nicht!" (**Rudolf Rolf**s)

- Alternative Economies; summary of strategies on a culturally loathsome subject from the depths of disorganization

by Sarah Lewison

socialsculpture@yahoo.com

<http://www-apparitions.ucsd.edu/~slewison/>

(bribery accounts for 1 trillion \$US of the world economy) (1)

what is the meaning of our exchanges, given that they all indicate exchanges of value- so what do they do? internet new practices of exchange are rather common- how to move to material practices.

what is the possibility of collaborating toward economic change? alternative approaches to economic transactions-- what would this mean

money as forced cooperation: contradictory because we make lots of little decisions and don't uniformly participate, but only as much as we need to or are accustomed to. not systematic, but questions both as to how we will be able to use internet increasingly to critique facilitate transactions and support different kinds of organizing, and second, how to bring resistant ideas back to the material world-- HOLmes' qustion; How to play the exhibition game in such a way that something real can actually be won? how to configure critical and radical cultural practices as mobilizing force.

Polanyi, The Great Transformation, '94, a critique of foundations of economics liberalism and technological determinism: rather than being embedded in social relations, the economy we currently have constitutes our social relations. Society is an accessory of the economy.

cultural production: as accessory of economy; subculture of creative production; precarious, physically discontinuous-- we are the ambassadors of good intentions

what follows conflates life and art practices, art people are familiar with, examining them from the perspective of economics, collaboration and distribution, rather than art criticism

tournaments of value (21 arjun appadurai-- The Social Life of Things): circulation of things around a

community, describes the community (model- several overlapping circles?) circulating through traditional art contexts, our value as artists corresponds to a market auction; what have we done that was interesting, followed by another thing, encountering fluctuations.

values-- different tournament- what happens in net, list serves, among self-produced liaisons

as many sided monads or operatives, we turn different sides to those productions, modulate them distinctively-- perhaps

external value is constructed through publicity; circulation of the project; meanwhile attempts to construct stable values internally-- circulation of ideas-- imitation of strategies-- sharing software

control on substances of value: alcohol, fuel, drugs; ways of making money my value peaks 95? with FAt of the land: (2) dated. but still circulating in wider public;. what we were doing was eco-friendly and that, but also we were making money. and there is cache to that-- right now, at the same time this movement is being historicized, they are seeking to regulate it.

the home distilled cocktail; money out of the nation's expected revenue-- artificially scripted alcohol and prohibition: anarchist ideas of mutualism; fair off-market exchanges of labor and commodities gain credibility as part of the popular resistance to prohibition. Mutualism is an interaction in which organisms in a close relationship derive some degree of benefit. Mutualism is usually temporary or not obligatory, and is one basis for ideas about free cooperation:

if capitalism is form of forced cooperation: what exchanges are materially oppositional; what other means to survive? gifts, barter, communality, organizing, coops, theft (or as the Situationists called it 'liberation of the commodity', alternative currencies, tax resistance, -job sharing

gift- can be exchange that is temporal; 3 different kinds-- familial, associative, strangers

be already afoot ; how we invite each other places, or recommend someone to an exhibit-- sometimes these operate like a gift, if there is risk at stake for the person who is giving; this is a kind of gift--

There is a calculative dimension to all exchange. the giving of the gift sets up the expectation of how this will be moved around.

off the dusty shelf: collaborating with the dead communalism; anarchistic; La Commune, (peter watkins film) english diggers flashes of utopia- communes, cockettes; free exchange, diggers, everything is free, rent is 35 bucks, acid

basis of murray bookchin's early work, he thought it political- later retracts this view (was spiritual) that god thing-- depoliticized ethics- research into open land movement; experience of people who lived there; -- embodiment; permissiveness

(yippies?)

contemporary 'free spaces' and attempts to equitably include public cultural conflict: debate -cf
Messhall in Chicago

Man B: we can't charge money for anything in this space because we are getting it for free, we can then produce an atmosphere outside of market capitalism. chance to redefine exchange; what happens here is entirely voluntary and purely the exchange of freely cooperating, everything distributed here should always be free

Man D: there are different cultures of thought regarding money, and we exclude certain cultures and avoid critical reflection of realities of market by having a standard rule that everything is free. an artist who labors should be able to produce value from this labor if he wants. otherwise our space will only reflect the homogeneity of our specific training, if we do not allow for exceptions to this rule

(what are the assumptions, expectations for each of these?--

Decisions about free exchange exposes the differentials; there is no natural unity; is there always a membrane or barrier between those who have and who don't, incommensurable barrier of static inequivalence and speech (can't be spoken about except to intimates). The extreme dramatization of this is the man who sells his wife for a meal. The job of redistributing the lack of 'wealth' on one side of the barrier belongs to someone else; the state, but is non-functional. Software is free but doesn't pay the rent.

Individually, is this a taboo subject? As cooperation/ collectivity/ etc, does the subject gain a platform? is interpellation possible?

banking on trust N55 proposal to share income among set group of people

70s and 80s some stories circulated of a kind of personal micro-finance; they were kind of early tales about the effectivity of social networks, pre-internet. someone wants to buy a piece of property writes everyone they know, and maybe this is copied and extended. the request is for small loans that won't kill anyone; they are slowly repaid over the years.

House posted on rTMark: pledges from strangers, collective purchase and constitution of a corporation on the basis of purchasing property. why did they pledge? it was clear there would be 17000 other buyer, they were going to get dust motes, did they think of it as a gift-- or as ownership. Utopian, too expensive, but bldg would have had to be managed somehow in the interest of a wider public. would be a long experiment.. pledges added up to \$7000, not bad but not enough

critical organizing: accessing the body of practices used by workers

art strike, tongue in cheek rhetoric, backed by sincere argument for change; radical valuation of cultural work (3)

addressing economic precariousness as flexibility extends to all areas of labor. unevenness of employment-manipulation of labor not only by the industries, but between competing factions;

resistance to cooperation.

temporary overtime: seek to represent flexible and disorganized labor, provide grounds for organizing, recover histories, and bring discussion of this industrial maneuver into a more public arena

Black Cloud over Vegas (2001 unrealized): working with organized labor: physical mani occupying entire strip and air space (4)

Precarias de la Deriva: Spain: walking with precarious women; speculate about re-figuring categories of unity, also physically embodied, narrativized thorough the way the workers occupy and use the city, (5)

Association of intermittents de la Spectacle in France, struggle throughout 2003 and the assimilation of television technical labor into the same category: pop idol interuppted; "Eiteinez vos teles" this year, 40,000 scientists join in with Intermittents and other educated labor, deploring an attack on the intelligence of the nation. just prior to the election (6) (7)

sig of Academic Student Unions: (mark warshaw, vp ASE/UAW) ASE in Cali is part of UAW, because they had the money and membership to support them through a long struggle for ratification by the university. it almost took 20 years, just signed 2nd contract. Now, between UC and newly organized Cal and U of W, ASE has 20,000 members, more than 1/4 of UAW's western region membership. reflects the shift of the site of production to work having to do with information, and requiring high degrees of cognitive and social processing, what Negri calls finesse.

ASE organizers talk about the plateaus of participation by new signees. at first a process of re-examining relation to how they think of their work and the university. some begin organize, or become interns at the Labor Center at UCLA: why why is this important. the numbers are getting large enough and the membership is excited and sees potential for political leverage. they are preparing actions to oppose states proposed cuts to the university from walkouts to civil disobedience on the day of the strike. particular uni culture; everyone is Temporary: demands are higher for constructing paths of continuity-- uni restored as site for politicization and organizing- members look ahead to election-- speculate; percentage of members continue creative organizing -

value of embodiment ; standing on a barricade Representation of this embodiment, however is problematic- what is the goal of this representation, the insouciance Sholette refers to--- Superflex; barricade--?

why else think about economic assemblages? market affect- The Strike and the Boycott: word of mouth party General Strike: Not a lightbulb shines, not a telephone rings, not a wheel turns without the permission of proletariat.

Radical Media Pragmatism; flashy radical tactics critically interrogating rules and protections of capitalization and capitalist exchange

rTMark: etoy so successful; was that final word on directly attacking the business ethics of a corporation so triumphantly

voteauction.com-- 1976 Buckley v Valeo-- constitutional ruling equated money with free speech. although free speech still doesn't equal money. one argument against this is that lawyers who want more than 1/2 an hour to sum up their arguments to the court could pay for extra time. (8)

Minerva Cuevas launched the Mejor Vida Corp in the late 90s, distributing for free such things as personalized university identification cards bar code stickers. only for a few things and certain stores. she provided a number of personal services. She got a gallery in Paris to write rec. letters for jobless individuals. (9)

some of cueva's ideas were already practiced in libertarian and anarchist cultures; for years people have been copying and distributing passports, train tix etc. there is a whole network of young people in the united states who share info on train schedules for train hopping, reproduce greyhound bus passes, etc. she brings it into another critical lite and audience

recode.com: (liberating capital) improves upon Cueva's bar code project by providing an interactive database of upc codes. the user punched in the item, and recode spat out the correct sticker. the stickers were likely used, but there is no record-- nathan talks about them as being quick strikes, reach only a certain amount of people; CDL: engagement with anarchist and punk culture -- Michel Chevalier- artist and theorist in Hamburg writes about the autonomy of punk culture; keep control over distribution (10) also the young social ecologists--

yomango; a diy lexicon in shoplifting-- large participation, pre-existing cultural habit; people do survive from what they have shoplifted, and Spanish laws against shoplifting mild compared to in US, project is a celebration of a defiant culture-- this open flaunting of authority of the commodity is a continuing manifestation of the energy generated by the collaboration several activist art collaborations as a meta agencia; Las Agencias-- collaborations within a collaboration--

las agencias: their participation in the show (xxx name?) at Museum of Contemporary Art in Barcelona, 2000, where museum money for the exhibit is used to fund purchases for the movements in Spain, including the bus and computers-- coinciding with G7 meeting in Barcelona, the group achieves a highly creative street visibility in the ensuing protests, and practices and ideas established out of the week long workshop continue to spread and diversify.

duration and continuity not necessarily attractive to institutional publicity campaigns, loses attention; how to keep it going, elongate attention, form or support other associations to reuse or recirculate ideas-- multiply into forking campaigns,

(this is going on with various mobile 'street writer' mechanisms, with successive generations attempting to improve their functionality and heterogeneity of messages)

anonymity as to authorship of the project, and conditions of diverse collaboration at initiating phases facilitate possibilities of duration and continuity

Practices and theories:

Horizontalidad: new languages for association (Argentina) Marina Sitrin and Emilio Sparato wrote a piece for the upcoming Journal of Aesthetics and Politics about the language of association is changing in Argentina as people activate new ways of working and surviving in cooperation. horizontalidad; collective protagonism, autogestion :

Alternative currencies: Ithaca Hours. retain economic wealth in local economy and retain control. Ithaca Hours since 1991, issued over \$100,000. promotion may outpace the practice? Hours promotion: expand the local money supply, local shopping, double the local minimum wage to \$10.00, subsidize premium prices for local goods and food. foster new businesses and jobs, reduce dependence on imports and fuel, grant making, zero-interest loans, stimulate community pride

thousands of residents, 500 businesses (bank, movie theaters, health clubs, farmers and hospital), have traded several million dollars with Ithaca Hour. value= one hour of basic labor or \$10.00. There are now dozens of HOUR systems in North America (from Brooklyn to Santa Barbara) and worldwide (from China to Argentina) based on this model. (from their promo)

Same principle of intra-community circulation and profitability used to enhance sustainability goals has led to addition of a credit union, stock exchange, and a health care system.

Cooperatives: not entirely dead; ag coops all along, but they are often compromised by agribusiness interests; the 70s food coop and conspiracy movement linked to the back to the land movement and still is in some regions, where it was difficult to farm by industrial standards. The point was to continue building these alternative avenues for commodities; supporting them with networks of collectively and cooperatively managed warehouses, and even transportation. It was intended to be a vertically integrated sub-economy that existed within American capitalism, refusing excess profit and hierarchy. Most were forced to close by building regulations, or succumbed to entrepreneurship, internal conflict or external competition as organic foods became more popular and less politicized. Michael Doyle, a historian of American counterculture calls these zones Ecological niches of conviviality-- an unglaciated valley in Minnesota near the Mississippi, there is still a colony of unregulated housing, a cooperative mill, a coop and until recently a cooperative warehouse, recently bought out. (11)

Mondragon Cooperatives are kind of a chain, based in Spain and concentrated in the Basque region. They claim to be one of the biggest corporations in Spain. Profits go to charity and to a collectively owned account. there now is a bakery in SF which is MOndragon. workers invest in the business. They see themselves as emerging from social relationships: "The Coop always begins a new enterprise with a group of people who are friends, never with just one person. It sees the natural bonds of friendship as a building block for which successful ventures are built." (12)

again there is the problem of integration between the barrier of inequalities: an unemployed person cannot afford to shop at the coop,-- cannot afford to buy commodities which pay their workers a living wage.

Theoretical movements: acknowledge Oliver Ressler's project- interviewing proponents of various alternative economic movements- i am doing a little follow up (13)

libertarian municipalism- forms of participatory democracy based in community building, politics and

economics. emphasizing local decision making, and full citizen participation at every level and cooperative economic forms. presupposes restraint of scale to allow for a demos, an assembly consisting of all units, and then the voluntary confederation of such communities

bookchin and takis fotopolous main proponents: : Also called social ecology, it is an amalgam of socialist, democratic, identity, ecological, and direct democracy politics Fotopolous: An authentic social ecology is inspired by a vision of human communities achieving their fulfilment as an integral part of the larger, self-realising earth community...social ecology is an attempt to understand the dialectical movement in society within the context of the larger dialectic of society and nature.

They diverge on the issue of economics.

Murray Bookchin of the Institute for Social Ecology believes the general assembly of citizen/residents in the municipality should make the overriding decisions for all areas of production. He sees small proprietary concerns as co-existing with larger cooperatively managed and owned sites of production.

Takis Fotopolous, one of those Ressler interviewed, advocates a rationalized approach that divides the demos among four instrumental social categories; 1. political or direct democracy 2 economic level divided into two assemblies; production and consumption 3 social level, workplaces: production facilities, schools, household 4 ecological democracy; how to integrate society into nature

the multiple levels involve a cumbersome number of meetings to decide which and how much of goods to produce, and then how to go about it.

Another movement that claims the title of social ecology is more inflected with the spiritual eco-communitarianism of Arne Naess, the Swedish philosopher who coined the term 'deep ecology'. It is a kind of voluntary associationist bioregional movement wherein citizenship is driven by one's place in the bios--

ASN: Augmented Social Networks describes a new architecture for the internet that would more practically enable connections between people working in technical fields with those working in social fields.

Move-on bakesale ?

pragmatic multitudinism authorship and circulation ratio of spectacle to reusable practice:deliberate and subtle decisions about positioning work meta collections of collectives: anonymous and large- travel farther new pedagogies and heterogeneous alliances: change is located in practices structure habitus teknological mutualism: marketization always followed enclosure of the commons, it won't be bad to see how this will work in reverse.

- Alternative Economies; summary of strategies on a culturally loathsome subject from the depths of disorganization

by Sarah Lewison

socialsculpture@yahoo.com

<http://www.apparitions.ucsd.edu/~slewis/>

(bribery accounts for 1 trillion \$US of the world economy) (1)

what is the meaning of our exchanges, given that they all indicate exchanges of value- so what do they do? internet new practices of exchange are rather common- how to move to material practices.

what is the possibility of collaborating toward economic change? alternative approaches to economic transactions-- what would this mean

money as forced cooperation: contradictory because we make lots of little decisions and don't uniformly participate, but only as much as we need to or are accustomed to. not systematic, but questions both as to how we will be able to use internet increasingly to critique facilitate transactions

and support different kinds of organizing, and second, how to bring resistant ideas back to the material world-- HOlmes' qustion; How to play the exhibition game in such a way that something real can actually be won? how to configure critical and radical cultural practices as mobilizing force.

Polanyi, The Great Transformation, '94, a critique of foundations of economics liberalism and technological determinism: rather than being embedded in social relations, the economy we currently have constitutes our social relations. Society is an accessory of the economy.

cultural production: as accessory of economy; subculture of creative production; precarious, physically discontinuous-- we are the ambassadors of good intentions

what follows conflates life and art practices, art people are familiar with, examining them from the perspective of economics, collaboration and distribution, rather than art criticism

tournaments of value (21 arjun appadurai-- The Social Life of Things): circulation of things around a community, describes the community (model- several overlapping circles?) circulating through traditional art contexts, our value as artists corresponds to a market auction; what have we done that was interesting, followed by another thing, encountering fluctuations.

values-- different tournament- what happens in net, list serves, among self-produced liaisons

as many sided monads or operatives, we turn different sides to those productions, modulate them distinctively-- perhaps

external value is constructed through publicity; circulation of the project; meanwhile attempts to construct stable values internally-- circulation of ideas-- imitation of strategies-- sharing software

control on substances of value: alcohol, fuel, drugs; ways of making money my value peaks 95? with FAt of the land: (2) dated. but still circulating in wider public;. what we were doing was eco-friendly and that, but also we were making money. and there is cache to that-- right now, at the same time this movement is being historicized, they are seeking to regulate it.

the home distilled cocktail; money out of the nation's expected revenue-- artificially scripted alcohol and prohibition: anarchist ideas of mutualism; fair off-market exchanges of labor and commodities gain credibility as part of the popular resistance to prohibition. Mutualism is an interaction in which organisms in a close relationship derive some degree of benefit. Mutualism is usually temporary or not obligatory, and is one basis for ideas about free cooperation:

if capitalism is form of forced cooperation: what exchanges are materially oppositional; what other means to survive? gifts, barter, communality, organizing, coops, theft (or as the Situationists called it 'liberation of the commodity', alternative currencies, tax resistance, -job sharing

gift- can be exchange that is temporal; 3 different kinds-- familial, associative, strangers

be already afoot ; how we invite each other places, or recommend someone to an exhibit--

sometimes these operate like a gift, if there is risk at stake for the person who is giving; this is a kind of gift--

There is a calculative dimension to all exchange. the giving of the gift sets up the expectation of how this will be moved around.

off the dusty shelf: collaborating with the dead communalism; anarchistic; La Commune, (peter watkins film) english diggers flashes of utopia- communes, cockettes; free exchange, diggers, everything is free, rent is 35 bucks, acid

basis of murray bookchin's early work, he thought it political- later retracts this view (was spiritual) that god thing-- depoliticized ethics- research into open land movement; experience of people who lived there; -- embodiment; permissiveness

(yippies?)

contemporary 'free spaces' and attempts to equitably include public cultural conflict: debate -cf Messhall in Chicago

Man B: we can't charge money for anything in this space because we are getting it for free, we can then produce an atmosphere outside of market capitalism. chance to redefine exchange; what happens here is entirely voluntary and purely the exchange of freely cooperating, everything distributed here should always be free

Man D: there are different cultures of thought regarding money, and we exclude certain cultures and avoid critical reflection of realities of market by having a standard rule that everything is free. an artist who labors should be able to produce value from this labor if he wants. otherwise our space will only reflect the homogeneity of our specific training, if we do not allow for exceptions to this rule

(what are the assumptions, expectations for each of these?--

Decisions about free exchange exposes the differentials; there is no natural unity; is there always a membrane or barrier between those who have and who don't, incommensurable barrier of static inequivalence and speech (can't be spoken about except to intimates). The extreme dramatization of this is the man who sells his wife for a meal. The job of redistributing the lack of 'wealth' on one side of the barrier belongs to someone else; the state, but is non-functional. Software is free but doesn't pay the rent.

Individually, is this a taboo subject? As cooperation/ collectivity/ etc, does the subject gain a platform? is interpellation possible?

banking on trust N55 proposal to share income among set group of people

70s and 80s some stories circulated of a kind of personal micro-finance; they were kind of early tales about the effectivity of social networks, pre-internet. someone wants to buy a piece of property writes

everyone they know, and maybe this is copied and extended. the request is for small loans that won't kill anyone; they are slowly repaid over the years.

House posted on rTMark: pledges from strangers, collective purchase and constitution of a corporation on the basis of purchasing property. why did they pledge? it was clear there would be 17000 other buyer, they were going to get dust motes, did they think of it as a gift-- or as ownership. Utopian, too expensive, but bldg would have had to be managed somehow in the interest of a wider public. would be a long experiment.. pledges added up to \$7000, not bad but not enough

critical organizing: accessing the body of practices used by workers

art strike, tongue in cheek rhetoric, backed by sincere argument for change; radical valuation of cultural work (3)

addressing economic precariousness as flexibility extends to all areas of labor. unevenness of employment-manipulation of labor not only by the industries, but between competing factions; resistance to cooperation.

temporary overtime: seek to represent flexible and disorganized labor, provide grounds for organizing, recover histories, and bring discussion of this industrial maneuver into a more public arena

Black Cloud over Vegas (2001 unrealized): working with organized labor: physical mani occupying entire strip and air space (4)

Precarias de la Deriva: Spain: walking with precarious women; speculate about re-figuring categories of unity, also physically embodied, narrativized thorough the way the workers occupy and use the city, (5)

Association of intermittents de la Spectacle in France, struggle throughout 2003 and the assimilation of television technical labor into the same category: pop idol interrupted; "Eiteinez vos teles" this year, 40,000 scientists join in with Intermittents and other educated labor, deploring an attack on the intelligence of the nation. just prior to the election (6) (7)

sig of Academic Student Unions: (mark warshaw, vp ASE/UAW) ASE in Cali is part of UAW, because they had the money and membership to support them through a long struggle for ratification by the university. it almost took 20 years, just signed 2nd contract. Now, between UC and newly organized Cal and U of W, ASE has 20,000 members, more than 1/4 of UAW's western region membership. reflects the shift of the site of production to work having to do with information, and requiring high degrees of cognitive and social processing, what Negri calls finesse.

ASE organizers talk about the plateaus of participation by new signees. at first a process of re-examining relation to how they think of their work and the university. some begin organize, or become interns at the Labor Center at UCLA: why why is this important. the numbers are getting large enough and the membership is excited and sees potential for political leverage. they are preparing actions to oppose states proposed cuts to the university from walkouts to civil disobedience on the day of the strike. particular uni culture; everyone is Temporary: demands are higher for constructing paths of

continuity-- uni restored as site for politicization and organizing- members look ahead to election-- speculate; percentage of members continue creative organizing -

value of embodiment ; standing on a barricade Representation of this embodiment, however is problematic- what is the goal of this representation, the insouciance Sholette refers to--- Superflex; barricade--?

why else think about economic assemblages? market affect- The Strike and the Boycott: word of mouth party General Strike: Not a lightbulb shines, not a telephone rings, not a wheel turns without the permission of proletariat.

Radical Media Pragmatism; flashy radical tactics critically interrogating rules and protections of capitalization and capitalist exchange

rTMark: etoy so successful; was that final word on directly attacking the business ethics of a corporation so triumphantly

voteauction.com-- 1976 Buckley v Valeo-- constitutional ruling equated money with free speech. although free speech still doesn't equal money. one argument against this is that lawyers who want more than 1/2 an hour to sum up their arguments to the court could pay for extra time. (8)

Minerva Cuevas launched the Mejor Vida Corp in the late 90s, distributing for free such things as personalized university identification cards bar code stickers. only for a few things and certain stores. she provided a number of personal services. She got a gallery in Paris to write rec. letters for jobless individuals. (9)

some of cueva's ideas were already practiced in libertarian and anarchist cultures; for years people have been copying and distributing passports, train tix etc. there is a whole network of young people in the united states who share info on train schedules for train hopping, reproduce greyhound bus passes, etc. she brings it into another critical lite and audience

recode.com: (liberating capital) improves upon Cueva's bar code project by providing an interactive database of upc codes. the user punched in the item, and recode spat out the correct sticker. the stickers were likely used, but there is no record-- nathan talks about them as being quick strikes, reach only a certain amount of people; CDL: engagement with anarchist and punk culture -- Michel Chevalier- artist and theorist in Hamburg writes about the autonomy of punk culture; keep control over distribution (10) also the young social ecologists--

yomango; a diy lexicon in shoplifting-- large participation, pre-existing cultural habit; people do survive from what they have shoplifted, and Spanish laws against shoplifting mild compared to in US, project is a celebration of a defiant culture-- this open flaunting of authority of the commodity is a continuing manifestation of the energy generated by the collaboration several activist art collaborations as a meta agencia; Las Agencias-- collaborations within a collaboration--

las agencias: their participation in the show (xxx name?) at Museum of Contemporary Art in Barcelona, 2000, where museum money for the exhibit is used to fund purchases for the movements in Spain,

including the bus and computers-- coinciding with G7 meeting in Barcelona, the group achieves a highly creative street visibility in the ensuing protests, and practices and ideas established out of the week long workshop continue to spread and diversify.

duration and continuity not necessarily attractive to institutional publicity campaigns, loses attention; how to keep it going, elongate attention, form or support other associations to reuse or recirculate ideas-- multiply into forking campaigns,

(this is going on with various mobile 'street writer' mechanisms, with successive generations attempting to improve their functionality and heterogeneity of messages)

anonymity as to authorship of the project, and conditions of diverse collaboration at initiating phases facilitate possibilities of duration and continuity

Practices and theories:

Horizontalidad: new languages for association (Argentina) Marina Sitrin and Emilio Sparato wrote a piece for the upcoming Journal of Aesthetics and Politics about the language of association is changing in Argentina as people activate new ways of working and surviving in cooperation. horizontalidad; collective protagonism, autogestion :

Alternative currencies: Ithaca Hours. retain economic wealth in local economy and retain control. Ithaca Hours since 1991, issued over \$100,000. promotion may outpace the practice? Hours promotion: expand the local money supply, local shopping, double the local minimum wage to \$10.00, subsidize premium prices for local goods and food. foster new businesses and jobs, reduce dependence on imports and fuel, grant making, zero-interest loans, stimulate community pride

thousands of residents, 500 businesses (bank, movie theaters, health clubs, farmers and hospital), have traded several million dollars with Ithaca Hour. value= one hour of basic labor or \$10.00. There are now dozens of HOUR systems in North America (from Brooklyn to Santa Barbara) and worldwide (from China to Argentina) based on this model. (from their promo)

Same principle of intra-community circulation and profitability used to enhance sustainability goals has led to addition of a credit union, stock exchange, and a health care system.

Cooperatives: not entirely dead; ag coops all along, but they are often compromised by agribusiness interests; the 70s food coop and conspiracy movement linked to the back to the land movement and still is in some regions, where it was difficult to farm by industrial standards. The point was to continue building these alternative avenues for commodities; supporting them with networks of collectively and cooperatively managed warehouses, and even transportation. It was intended to be a vertically integrated sub-economy that existed within American capitalism, refusing excess profit and hierarchy. Most were forced to close by building regulations, or succumbed to entrepreneurship, internal conflict or external competition as organic foods became more popular and less politicized. Michael Doyle, a historian of American counterculture calls these zones Ecological niches of conviviality-- an unglaciated valley in Minnesota near the Mississippi, there is still a colony of unregulated housing, a cooperative mill, a coop and until recently a cooperative warehouse, recently bought out. (11)

Mondragon Cooperatives are kind of a chain, based in Spain and concentrated in the Basque region. They claim to be one of the biggest corporations in Spain. Profits go to charity and to a collectively owned account. there now is a bakery in SF which is MOndragon. workers invest in the business. They see themselves as emerging from social relationships: "The Coop always begins a new enterprise with a group of people who are friends, never with just one person. It sees the natural bonds of friendship as a building block for which successful ventures are built." (12)

again there is the problem of integration between the barrier of inequalities: an unemployed person cannot afford to shop at the coop,-- cannot afford to buy commodities which pay their workers a living wage.

Theoretical movements: acknowledge Oliver Ressler's project- interviewing proponents of various alternative economic movements- i am doing a little follow up (13)

libertarian municipalism- forms of participatory democracy based in community building, politics and economics. emphasizing local decision making, and full citizen participation at every level and cooperative economic forms. presupposes restraint of scale to allow for a demos, an assembly consisting of all units, and then the voluntary confederation of such communities

bookchin and takis fotopolous main proponents: : Also called social ecology, it is an amalgam of socialist, democratic, identity, ecological, and direct democracy politics Fotopolous: An authentic social ecology is inspired by a vision of human communities achieving their fulfilment as an integral part of the larger, self-realising earth community...social ecology is an attempt to understand the dialectical movement in society within the context of the larger dialectic of society and nature.

They diverge on the issue of economics.

Murray Bookchin of the Institute for Social Ecology believes the general assembly of citizen/residents in the municipality should make the overriding decisions for all areas of production. He sees small proprietary concerns as co-existing with larger cooperatively managed and owned sites of production.

Takis Fotopolous, one of those Ressler interviewed, advocates a rationalized approach that divides the demos among four instrumental social categories; 1. political or direct democracy 2 economic level divided into two assemblies; production and consumption 3 social level, workplaces: production facilities, schools, household 4 ecological democracy; how to integrate society into nature

the multiple levels involve a cumbersome number of meetings to decide which and how much of goods to produce, and then how to go about it.

Another movement that claims the title of social ecology is more inflected with the spiritual eco-communitarianism of Arne Naess, the Swedish philosopher who coined the term 'deep ecology'. It is a kind of voluntary associationist bioregional movement wherein citizenship is driven by one's place in the bios--

ASN: Augmented Social Networks describes a new architecture for the internet that would more

practically enable connections between people working in technical fields with those working in social fields.

Move-on bakesale ?

pragmatic multitudinism authorship and circulation ratio of spectacle to reusable practice: deliberate and subtle decisions about positioning work meta collections of collectives: anonymous and large- travel farther new pedagogies and heterogeneous alliances: change is located in practices structure habitus technological mutualism: marketization always followed enclosure of the commons, it won't be bad to see how this will work in reverse.

Add search to your site

Google WebSearch

Enable your online visitors to search the web with Google WebSearch. Google indexes billions of pages, images, and documents in hundreds of file types to help people find what they want.

And with Google WebSearch, they can find what they want from your website.

Take Google with you

Mobile Solutions

With Google Mobile WebSearch, your users can search not just the Mobile Web but the entire web. No other search engine can provide this service.
